AN ADDRESS TO THE PUBLIC ON THE

#### SUBJECT OF INSANITY,

Embellished with an elegant Frontispiece.

BY THE SAME AUTHOR.

#### ADVERTISEMENT.

By the following Cases, collected with care, chosen with a view to real utility, and reported with fidelity, it will be easily feen that the author has no defign to obtrude any nostrum or specific upon the public, but merely to exhibit the refult of his own practice and observations, in a malady of the greatest importance, in which a considerable number of perfons are deeply concerned. He has held forth no ideal speculations, or fantastic theories, which might furnish matter of fanciful conjecture, but, contenting himself with

plain facts, unincumbered with tedious and uninteresting particulars, and divested of useless minutiæ, he flatters himself that the integrity of his intention will, undifguifedly, appear to the eye of candour, and ferve to palliate every degree of illiberal criticism. Be that as it may, of this he is well affured, that, should the practice of medicine receive the least accession from his experience and endeavours, he will think his time well spent, and his studies well directed; and, for the indulgent reception of his past labours, the Public are entitled to his most grateful acknowledgments.

# DEDICATION.

Carbilladiu T O marcal dim DOT

### JOHN COAKLEY LETTSOM,

M. D. F. R. S. AND A. S.

DEAR SIR,

"THE permission,

THE CONTRACTOR

which you have so politely granted, of dedicating the following sheets to you, I regard, not merely as a testimony of some little professional tenderness and skill, constantly, however, to the best of my abilities, exerted towards the relief of such of my fellow-creatures whose complaints involve the last state of human misery, but as a proof of private friendship, and a record of your own feelings, whenever humanity can be exercised or displayed.

#### [ viii ]

"Under these impressions, I will not further trespass upon your time; you will, however, be pleased to accept of my most fervent gratitude for so very respectable a fanction, and permit me to subscribe myself,

Dear Sir,

Your most obliged,

And obedient Servant,

W. PERFECT."

#### CASEI.

A Gentleman, aged fifty-eight, was, in the beginning of January, 1770, put under my care for infanity. The cause of his disorder was attributed to a sudden transition in his circumstances, which, from being easy and comfortable, were become doubtful and precarious; his complaints were great pain in the head, almost a continual noise

in his ears, and, at intervals, a melancholy depression, or a frantic exaltation of spirits; he was inclined to be costive. his water was very high-coloured, he passed whole nights without sleep, sometimes raved and was convulfed, and his attention was invariably fixed to one object namely, that he was ruined, loft, and undone! which was his inceffant exclamation both by night and day. Strong purges, antimonial vomits, ammoniac draughts, fagapenum, steel, and both kinds of hellebore had alternately been exhibited; iffues, venæsection, a seton, and vesicatories had been tried for a feries of time; bathing, and, in short, almost every thing, seemed to have been done without the least visible alteration for the better. He had, however, never

been removed to a proper place of retirement, nor had he ever been sufficiently excluded from company, or prohibited the conversation of such, whose curious impertinence served only to heighten and inflame his malady. When I undertook the care of this person, he appeared very impatient of contradiction; and, even discoursing with him in the most easy and gentle manner, would often ruffle him into a mis-construction of all that was said: I therefore forbade all forts of intercourse with his relations and acquaintance, till fuch time, as, in my opinion, it might be admitted without any manifest injury to the patient. And could the friends of afflicted maniacs in general, only be made thoroughly fenfible

of the prejudice that is often done them . by unnecessary conversation and affecting visits, they would, Ithink, most carefully abstain from both. The injunction, which I had prescribed, was very punctually observed, otherwise I might have met with infurmountable obstacles in the execution of my curative plan; which was begun by making a feton between his shoulders, and confining the patient to a still, quiet, and almost totally darkened room: I never fuffered him to be fpoken with, either by interrogation or reply, nor permitted any one to visit him but fuch whose immediate business it was to supply him with his aliment, which was light, cooling, and eafy of digestion; at the same time his conflant drink was weak and diluting; and this was the more absolutely necessary,

as his regimen, although frequently directed to be sparing and moderate, had never been properly regulated and attended to, a circumstance in itself exceedingly blameable, and only to be imputed to the mistaken indulgence of those about him. For twelve nights fuccessively he used the warm pediluvium, by which having rested something better than he had long before done, I was induced to go a step farther, and. after two purges, to try the effects of opium, which I began in the evening of the thirteenth day after he came to me, in the quantity of fifteen drops of the elixir paregoricum in two ounces of a weak camphorated julep. which caused him to sleep an hour at a time; and, through the whole of the day

following he appeared much easier and less anxious than usual; the elixir was now repeatedly increased, till his nights became thoroughly still and composed, and his days rendered fo free from perturbation of spirits and hurry and confusion of thoughts, that he talked rationally and just, seldom breaking out into any frantic rhapfodies, or paffionate expressions whatever. In this courfe I invariably perfevered for nearly four months, occasionally administering a fufficient dose of lenitive electuary to prevent too great a constipation of the bowels from the reiterated use of the paregorics; his reason now returned, his imagination grew stronger, his ideas were more collected, and he spoke of things as they really were,

and of the primary cause of his mental infirmity, with philosophic coolness, and resigned moderation. The seton was continued, but the opiate and pediluvium were gradually decreased, and entirely lest off on the second of sune following; when, after having been with me nearly five months, I restored him to his friends in that state of fanity, which he has happily preserved to the present period.

#### CASE II.

ON the twenty-ninth of December, 1770, I was confulted by letter in the case of a gentleman of Carey-street, London; he was about the age of two-

and-twenty, and, till within about twelve months before, had enjoyed a firm, rational mind and a good state of health; but, in consequence of a disappointment in a matrimonial treaty, from a cheerful and lively disposition, he at once became fad, dull, and penfive; destitute of his usual firmness and resolution, with almost a total privation of appetite, fleep, and spirits, and fond of folitude to an excess; for some weeks together he scarcely spoke a word, and, from a florid and healthful complexion, became pale, wan, and fickly. In about three months after this change took place, he was feized with a drivelling, which continued for five or fix days together; during which time he spoke with his usual facility and

ease, his appetite returned, he slept better, and enjoyed a partial return of his natural spirits and vivacity; but no fooner did this discharge cease, than he immediately reverted to his former gloomy and depressed state. The ptyalism continued periodically to return with every full moon; brought with it its exhilerating, and left its distressing, effects. After continuing in this state for the space of eight months, he was entrusted to my management and care on the fifteenth day of January 1771. Finding, upon enquiry, that many probable and regular methods of treatment had ineffectually been referred to, and fuppoling, by this periodical discharge of the falival glands, that Nature in self-assistance endeavoured to throw off

the peccant humours; as the patient was not altogether in fuch a state of laxity as to prohibit the experiment, and extremely defirous to try it, I refolved to prolong the next periodical flux by the affistance of calomel, exhibited, at proper intervals, in quantities proportioned to his strength; accordingly, about a week before the expected return of the falival discharge, I gave him every night at bed-time two grains of calomel, made up into a small pill with conferve of rofes and rhubarb; about the fifth day afterwards his breath became offensive, and he complained of a flight foreness in his mouth and gums; on the fixth day, in the evening, the sputation commenced, which was moderately encouraged, and the patient

supported with a diet suitable to his fituation; he appeared focial, cheerful, and contented, and, except the foreness of his mouth and gums, made no complaint at all. I continued to promote the flux in a small degree, until he had passed the next full moon, (at which time I observed there was no visible increase of the ptyalism) when I gradually began to carry off the mercury by lenient purges; but the sputation did not entirely cease till nearly the end of the feventh week from the first day of his beginning to take the calomel. I then opened him an iffue in his arm, and advised a purging draught of the foluble tartar, with a cool and sparing regimen at the approach, and till the decline of every

full moon. The ptyalism never afterwards returned, nor was he again subject to any of the complaints which used to recur upon its remission; the cortex was, for some time, exhibited to brace up and invigorate the habit, which had been much weakened and relaxed, and, being thoroughly recovered, he left my house in a state of good health on the second day of May 1771.

# CASE III.

MR. S. G. about forty-five years of age, after having for some years been fubject to acute rheumatic pains, and the internal hæmorrhoids, on a fudden, without any apparent cause, became low-spirited, dull, and melancholy, infomuch, that he was unable to follow his business as usual; he was frequently watchful, timorous, mistrustful, and despondent, and more than once. if he had not been providentially prevented, would have put an end to his existence: he was first attacked in the beginning of September 1772, and had then tried the advice of an apothecary in the place where he lived. In

November I received a message to visit him, and found him feated in his cuftomary attitude, his head reclining on his arm, and his eyes rivetted to the ground, as if lost in profound thought: I tried by feveral methods to rouse his attention, but to no purpose, and asked him feveral questions, but received no reply at all. I was informed he had taken vomits, purges, electuaries, and pills, and had then by him a volatile mixture to take every fix hours, and a blister between the shoulders; he passed but little water, his belly was bound, and his stomach and bowels were much inflated with wind; the pulse was flow and hard, and a fmall hæmorrhage, which he had from the internal hæmorrhoids for some days

past, was now stopt. The day before I faw him, he had ejected, by vomit, a great quantity of dark-coloured bile, with which the stool he had that day had was also observed to be tinged.— Little or no regard had ever been paid to his regimen, and, as his appetite was but very small at the best, he had been fuffered to indulge it with favoury meats and rich fauces, and other things, directly opposite to the state of his case; wine, malt liquor, and sometimes rum or brandy, had not been denied him; and his unwillingness to move, had prevented him from taking exercise in the open air, in that manner which might have been most ferviceable to him. At the time when I took him into my house, he had, I

think, the most incurious aspect which I ever beheld, and was so nearly approached to a degree of confirmed idiotism, that a fervant was always obliged to dress, undress, feed, and assist him in the common offices of nature. After a few days, I bled him, to the quantity of fix ounces; the complexion of the blood proved the vessels to be loaded with a superabundant quantity of humours, which clogged and loaded the circulation fo as to render depletion highly necessary. I prohibited his wonted freedom of diet. and confined him to a more flender and cooling one; he was often carried into the air, and took daily, in a bason of water-gruel, two drachms of foluble tartar. The pulse was greatly relieved. and foftened by the first bleeding; by the fecond, (at the distance of sourteen days) the effect was more promising; and, by a strict perseverance in the antiphlogistic plan, with repeated bleedings and a proper degree of exercise, the patient became susceptible of the dictates of propriety, fensible to the functions of nature, and entirely recovered his right fenses and understanding. The regimen now was gradually enlarged; and for some time after taking a decoction of valerian and the bark, to invigorate the fystem, he left me hearty and well in the March following, having come to me in November only; fince this cure, I have had feveral melancholics under my care who have received relief from the free use of the lancet, which,

CASE

in many fuch cases, seems to have been omitted from a mistaken prejudice; for, where the pulse is oppressed, contracted, and hard, and the folids not too much relaxed, to relieve and increase the circulation of the fluids, and affift the fecretions, experience fanctifies the indication, and has rendered the operation justifiable. I had a very particular case of this kind from MAR-DEN, in this county; the patient was a woman of the name of CORNWALL, she had long been immerfed in melancholy; and venæsection been reprobated by every one of the faculty who had feen her, and yet this patient recovered by repeated bleedings only, and has ever fince remained perfectly well.

# C A S E IV.

A LADY, in the thirty-seventh year of her age, of a delicate constitution, upon lying in of her fecond child, and about a month after her delivery, was feized with a shivering fit, succeeded by a fever, delirium, inflammation of the eyes, and watching. She was attended by gentlemen, eminent in the medical art; by whose affistance, in the space of three weeks, she was so far recovered as to be able to walk across the room; when, on a sudden, from a mistaken apprehension of her husband's conduct, she became anxious, reftless, irresolute, incoherently talkative, turbulent, and fo very mif-

chievous, that the attendants were obliged to confine her; spasms, raving, foaming at the mouth, involuntary laughter, or loud and shrill lamentations enfued; from a pleafing, open, and cheerful countenance, her face became contracted to a rigidly emaciated and truly maniacal appearance; and, from a decent and delicate choice of words, her expressions bordered upon the rankest blasphemy, or displayed the foulest obscenity. By the advice of the physicians, who attended her before, she had been four times bled within the space of three months; blisters had been applied to the occiput, back, and legs; a feton had been made in her neck; to lenient purges, cathartics had fucceeded; the gums, and

fætid anti-hysterics proved useless; vomits had been often repeated, and cold-bathing not omitted. All painful applications, and every method, hitherto used, had rather aggravated than lessened her complaint; and, in a state of infanity, little short of raving, she was committed to my care in May 1773; she had then a blister open on her back, and an issue in her arm; but, as no good effect had ever accrued from muscular irritation, they were both fuffered to dry up, and in a few days there was no discharge from either. I placed her in an apartment the most quiet and retired; gave her magnefia, occasionally to relax the bowels; and, for the heat and quickness of pulse, two spoonfuls of a saline mixture every

five or fix hours, with an addition in the evening of a few drops of the paregoric elixir were given. In a few days the fpasms abated, the symptoms were mitigated, and the febrile heats allayed the pulse, from a hundred and upwards, were reduced to near eighty; when a decoction of the peruvian bark and nitre was made use of. The intervals, from a few hours at first, were, in three weeks time, prolonged to a whole day and night, and fometimes two; from a week to a fortnight; then, three weeks; and, at length, till the phrenetic fymptoms entirely fubfided. During the continuance of this course, I suffered no one to visit or converse with her but myself and one female attendant, her relations and acquaintance.

being strictly enjoined, from the first, not to diffurb her by vifits, paid every necessary attention to that precaution. And by means of the above practice and management, with a regimen fuitably adapted to her fituation, in five months time, I had the happiness of restoring this lady to her worthy partner and family, and to the welcome reception of a large circle of genteel acquaintance, who had experienced many anxious feelings on her deplorable fituation.

#### CASE V.

LADY, about forty years of age, from a violent fanatical affection, which had possessed her mind for some months, at length became indifferent to every enjoyment of life, unable to perform the domestic duties of her family and had given several evident proofs of infanity; her ideas, in general, were confused, gloomy, and distressed; her apprehensions missounded, and her life fuch a burden to her, that she would have laid violent hands on herfelf, had she not been prevented. In this unhappy state she was conveyed to London for advice; had feveral vomits, and other medicines usually

given to patients in a fimilar fituation, and particularly the tinetura melampodii, the specific efficacy of which, as well as the anti-maniacal qualities fo much ascribed to hellebore, (a remedy of which the ancients had a most wonderful opinion) I am perfuaded, neither founded in truth nor experience: a blifter had likewife been applied to the back, and ordered to be kept open; but, in much less time than it could be reasonably expected she could find relief, her relations, for the conveniency of her being placed nearer to them, removed her in March 1773, to my house. A pale fettled melancholy feemed strongly impressed on her features; her eyes looked wild and staring; her nights were watchful and restless; and she often talked of reli-

gion in an incoherent, timorous, defponding, and mistaken manner. It was become absolutely necessary that all books, of religious tendency, should be removed from her fight, as she only brooded over them to increase her doubts and anxieties; and, of course. a Testament, which she had been suffered to have continually in her own possession, was taken from her, and the fervant was ordered, on no account, to answer any interrogations she might propose upon scripture and religion, or even to speak to her upon those subjects. She had been much too closely confined. and, as both air and exercise seemed necessary, every night and morning fhe was taken out for that purpose; and, as the pulse continued hard and tense, on the fixth day after she came to me, I took away fix ounces of blood, exhibited a fmall bolus of nitre, with equal quantities of castor and camphire, every night and morning for three weeks and between whiles, finding it necessary to keep the bowels in an open state, I ordered her the oleum ricini. About the close of the third week the bleeding was repeated; and, foon after, an expectoration, which was habitual to her and which had ceased from her first being taken ill, again returned, and other falutary excretions foon after following, the patient every day recovered strength of body, appetite, and firmness of mind. Being very defirous to return home, at the end of nine weeks, she was permitted. fo to do, to the great satisfaction of a

most worthy and tender husband and an affectionate deserving family, who have cheerfully and voluntarily confirmed the above success, much to the advantage of the practitioner, by the grateful relation of it to their general acquaintance.

#### CASE VI.

I Was confulted on the fourth of June 1773, in the case of Miss L. H. aged twenty-seven, who, from an amenorrhæa, was afflicted with lowness of spirits, violent tremors, hysterical suffocation, wandering, confused thoughts and ideas, giddiness, pains in the head

and stomach, loss of appetite, spasms, watchfulness, palpitation, and diminished perspiration; she became averse to company and conversation, and when, at any time, she did talk, it was in a vague, trifling, and whimfical manner, and the very reverse of her usual discourse; she frequently moaned, fighed, and was mopish; and at length, notwithstanding the repeated trial she had made of bleeding, cupping, electricity, vomits, anti-hysteric draughts. neurotics, and emmenagogues, fell into a deep melancholy. The pulse, when I first faw her, was small and irregular, but rather hard and quick; there was a constant throbbing in the temporal arteries, a dry convultive cough, her urine was pale and limpid, and she was frequently troubled with reachings and nausea; I gave her a weak antimonial vomit, and afterwards lac ammoniacum, with spiritus nitri dulcis and oxymel fcilliticum, and invariably purfued this course to the end of the third week, when finding no good effects enfue, I tried another antimo. nial emetic, and put her upon a course of valerian and steel; but this too, after a trial of fix weeks, proving equally inefficacious, and the patient growing rather worfe than better, on the fifth of August I began to use the warm pediluvium, which was continued every evening, giving her twice a day two scruples of camphire in the form of a bolus; and, although she perspired freely in the night, the pulse was much

quickened, and she complained of great thirst; therefore, without lessening the quantity of the camphire, fifteen grains of nitre were added to it, to be made into a bolus with the mucilage of gum arabic, which she took at bed-time, and at three o'clock in the morning, the pediluvium was also continued, drinking a cupful of penny-royal tea after each, till the twenty-fifth of the fame month, when the menfes which had been folong suppressed, appeared in their ulual quantity, for the space of four days; which, I was informed, was the usual time of their continuance when in her perfect health; the tremors abated, the hysterical suffocation subsided, the pains of her head and stomach were gradually appealed, her appetite was restored, her sleep was longer and more refreshing, and

her conversation became pure, easy, and uninterrupted. The camphire and nitre bolus was never omitted one night, till the fourth return of the menstrual flux, from their first re-appearance as above. Her diet, throughout the whole cure, had been particularly attended to, and chiefly confifted of nourishing spoon meats, and diluting liquids; but, as she grew better and the fystem was re-invigorated, she gradually returned to a regimen more folid, and added a mixture of wine to her barley-water, a beverage to which she had always shewn much partiality. She has not fince had the least return of her maniacal complaints, and continues exceedingly well.

# CASE VII.

MRS. B. a married lady of about thirty, rather of a leucophlegmatic habit, naturally inclined to despondency and of an inert disposition, was in May 1774, from the loss of a near relation, deeply afflicted with melancholy, infomuch, that she passed whole days and nights without uttering a word, and feemed very indifferent to her food, of which she took but very little; she was subject to loathings, eructations, distension of the stomach. pain, and heart-burn, had frequent reachings to vomit, would often fuddenly burst into tears, and cry vehemently; her countenance was pale and swelled, her aspect dejected, and her eyes were continually in motion; her urine was fometimes reddish, with a light fediment of the same colour, and sometimes it emitted fabulous concretions; at others, and in general, it was white and pellucid; her voice was faint, and almost incapable of distinct articulation, the tongue was parched and tremulous, and her pulse contracted, hard and unequal. Under these circumstances her relations applied to me; I took away from her arm fix ounces of blood, which, when cold, was covered with a thin cake of gluten, adhered to the fide of the vessel, and swam in too great a quantity of faffron-coloured ferum; foon after the bleeding I prescribed an antimonial vomit, with which she discharged a quantity of dark

bile; on the day following the began to take two scruples of camphire, in form of a bolus, every night and morning; on the eighth day of its continuance, an aggregate eruption of minute red pimples, refembling the herpes miliaris, broke out all over the surface of the body, and the day following she menstruated, which she had not done before fince the beginning of her illness. In a few days she recovered her voice, the apepfia went off, her countenance became more clear and lively, and she discoursed with her usual propriety; I continued the camphire, with a fmall addition of nitre, to the thirty-feventh day from its first exhibition; and, at the end of fix weeks, she was as well as she was ever remembered to have been for many years.

### CASE VIII.

THE unhappy patient, of whom I am about to speak, and whose case, I believe, exhibits an inflance scarcely to be found in the annals of furgery, was a game-keeper to a gentleman at Mereworth, near this town, in the forty-fifth year of his age, of a tall slender make, melancholy countenance, gloomy disposition, and vindictive temper. After labouring for fome time under great discontent of mind, caused by a displeasing change in his circumstances, he became fullen. morose, disturbed in his ideas, and fond of folitude. In the evening of the fifth of July 1773, he fuddenly

ftrayed away from home, and, not returning at his usual bed-time, filled the family with apprehensions for his safety, which, in the fequel, appeared but too well-grounded; for, about midnight, he was found by two men, who had been in fearch of him, lying in the hollow of an unfrequented meadow. welt'ring in his blood, with his throat cut in a most shocking manner; as the hæmorrhage had not been very considerable, and was now entirely stopped. he was capable of giving an account that he had done it himself with a razor. which he had fecreted for that purpose. Being able to walk home, a neighbouring furgeon was fent for, who, with much skill and precision, re-united the divided parts by future, and at-

tended him daily, but, as he often averred, with the most forlorn hope. of his recovery; the accomplishment of which was, indeed, in the opinion of every one, morally impossible. On the fixth day from the accident, the flitches were broken through, and partly thrown off by the digestion of the wound. A most horrible incision now appeared, of fix inches in extent, dividing the sterno hyodei muscles, the coraco hyoidaus and tarynx immediately above the thyroid cartilage, and more than two-fifths of the afophagus. The air, which issued from the trachea, was nearly fufficient to blow out a candle; but his voice and articulation was not fo much altered as one might have imagined, from the appearance of the

parts. Confidering the nature and dimensions of the wound, it was really furprifing how the carotid and jugular arteries escaped the edge of the instrument. After a confultation of his friends, on the thirteenth of July it was judged necessary to remove him from his own house to mine; for which purpose, I went to his residence, attended by proper affishants; to this measure he shewed a great degree of disgust and reluctance, and, notwithstanding he was much emaciated and under peculiar pain and embarrassment from so desperate a wound, it was not till after a very hard struggle of near half an hour, with our whole combined force, that we were able to confine him properly in a strait waistcoat; he was then

placed between two men in a chaife and conveyed to Malling; where, upon inspecting the wound, and finding a repetition of futures totally impracticable, we contented ourselves with cleanfing and dreffing the parts twice in a day, and applying a bandage, fo as to keep the head continually bent forwards with the chin to the fternum, fo that the lips of the wound might continue in close contact; his food entirely confisted of spoon meats, in the transit of which there was much difficulty of deglutition, and, unless a resistance was made with the hand against his throat when he swallowed, but little went down into the stomach, but ran through the divided parts, and appeared upon the dreffings. Yet, afto-

nishing as it may appear, in less than fix weeks, the parts were fo far healed, that he could, without any impediment, fwallow folids, and the opening was fo much contracted, as fcarcely to admit the end of a quill. At this time, from motives of economy, it was judged expedient to remove him to Bedlam, where he was admitted on the twentieth of August, in a state of health much beyond the expectation of every one who had the least knowledge of his case; and, I have fince been informed. that the wound is perfectly closed, and the cicatrix firm, even, and complete.

# C A S E IX.

A GENTLEMAN, much respected for the integrity of his conduct, who had been long in business, to which he had ever paid the most indefatigable attention, and who had acquired a competent fortune, at the age of fifty-eight, retired into the country, to spend a life of uninterrupted eafe and tranquility, without confidering, that the exertions, which he had so industriously used for the attainment of his fortune, were also the very fources from whence he derived his health and spirits; that habit is often more powerful than principle; and that the powers of a mind, which had been accustomed to an active life,

languishes for want of employment. He had not been longer than four months in the situation which he had mistakenly depictured to himself as the crowning of his wishes, when a listlessness ensued; the corpulency, to which he was naturally inclined, increased to a troublesome degree of bulk, he found himfelf depressed without knowing how to affign a cause for it, he complained of an uncommon pressure about the scrobiculus cordis, a fwelling and enlargement of his breaft. his appetite became depraved, his imagination bewildered, and his ideas were restless and confused; at times he complained of a violent tumultuous beating of the carotids, which was evident to those who were about him; the abdomen

was tense and costive, he made but little water, and that in general was thin and white; he complained of pain in his head and left hypochondriam, with tension and heat in the parts, he was thirsty and hot; he was subject to acid eructations, frequently laboured for breath, was often wild and extravagant in his actions and behaviour, frequently feized with tremors and dimness of fight, and, at length, fell an entire victim to a melancholy delirium, in which deplorable state, had he not been carefully watched and attended to, he must have fallen by his own hand; he was fullen and mute. frequently was feized with a grinding of his teeth, had involuntary catchings of the tendons, and feemed wearv of

existence; it was with much difficulty, that any fort of answer could be obtained from him to the interrogations of the physician who attended him, and who prescribed for him with that judgment and difcernment which had long marked the reputation of his diftinguished medical abilities. In vain, however, were issues opened, blisters applied, emetics administered, and baths advised; he became worse, even to the heaviest pressure of melancholy, and in that state was removed from his own house to mine. His tongue was generally dry, harsh, and discoloured; his countenance of a fallow hue, dull, and dejected; his eyes fierce, staring, and prominent, their lids much tumefied, and the pupils remarkably dif-

tended; his pulse was full, hard, and oppressed, and not more than fixty in a minute; he was averse to food, and it was often found difficult to get down a fufficient quantity for his fublistence. On the third day after coming to me, eight ounces of blood was taken from the arm, the ferum of which was bilious, fmall in quantity, and of a yellowish cast, the crassamentum, streaked with lentor, was tough and grumous; his diet, to which too little attention had been paid, was regulated with an exactness much more to be depended on in his new appointment than at his own house; a cooling emulsion with nitre was given him at least every eight hours, and every other night at bedtime, he took three drachms of foluble

tartar, in weak broth, which cooled, relaxed, and purged him; on the intermediate nights, a fmall pill, containing half a grain of emetic tartar, was administered and had the good effect to excite a gentle diaphoresis, to which he had shewn no disposition from the first of his illness; he passed more urine, which deposited a white light fediment. On the feventh morning after the first bleeding, the operation was repeated; when the complexion of the blood was much changed for the better, its texture was less tenacious. and the ferum more clear and less loaded with bile; the pulse became gradually fofter, less oppressed, and vibrated about feventy times in a minute; he replied with more facility,

and with a tolerable degree of rationality; appeared less dull and dejected, and was easy and tractable. The nitrous emulsion, soluble tartar. and emetic tartar, at longer intervals than at first, were respectively continued, till the latter end of the nineteenth week, in which time venæsection, in proportion to his strength, had been eight times repeated, and he was obviously better in every respect; his tongue became fost, clean, and moist; his countenance undifordered, rather pallid, but clear, and his conversation as ready, rational and unreferved as ever. About the beginning of the fixth month from his removal his return home was proposed to me, both by himself and friends, in which I acceded, advising him to use such a degree of exercise, as should appear necessary in proportion to his diet, and be more sparing of the latter than he was before his illness. I have the satisfaction to learn that my documents had their due weight; he now and then occasionally loses blood and takes a dose of the foluble tartar, and, by temperance and moderation, secures to himself those most valuable of earthly blessings, a healthful body and a sound mind.

#### CASEX.

THE young lady, whose case I shall next relate, was in the twenty-fourth year of her age, naturally of a brisk

CASES OF INSANITY, &c.

ANTLANO

lively disposition, but, from an irregular flux of the menses, subject to hysteric fits, which, at length, degenerated into raving madness; in consequence, her words and actions, from decent and rational, became wild, inconfistent, and extravagant; her anxiety was frequent and extreme; her appetite was fo much deprayed, that she would eat paper, cinders, thread, rags, bits of wall, or any thing that lay in her way, and sometimes so unnaturally voracious, that she would swallow her food in too large a quantity and without chewing it; her breath was extremely offensive; her countenance was truly hippocratic; she was restless, hot, and complained of pains in her back, loins, and bowels, with a fensation of

heat in the epigastric region; she had a dry, frequent, and painful cough, without the least expectoration, and pain in her thighs and legs; her blood, as I was informed by the furgeon who attended her, and who had thought proper to take away a few ounces, to moderate her frenzy, was florid, and of a loofe confishence, and not in the least coagulated in the bason; she often continued delirious three days and nights together, without any intermission and without the least perspiration, and her lucid intervals, at any time, feldom exceeded a few hours about the middle of the day; her stools were bilious, fætid, and high-coloured, but, in general, her urine was concocted, copious, and white; her flesh was flabby and

dry; immoderate fits of laughter, in quick transition, often followed involuntary crying, to which screams, yells, and horrid ravings often succeeded; her pulse was hard, quick, and small, and she was often seized with sudden fugitive spasms in her hands, arms, legs, and thighs. On the first of June 1776, she was placed immediately under my care; I began the cure with an antimonial emetic, in the operation of which she ejected a very long and broad worm, of that species which is called the tœnia, from the refemblance it bears to a piece of tape, and of which Dr. Samuel Foart Simmons, F. R. S. has lately favoured the world with a full and particular account; the warm pediluvium was the fame evening

begun, a course of the camphire and nitre entered upon, and both were continued to the end of the cure, except that on every fifth or fixth night, I thought it right to prescribe a vermifuge, of fifteen grains of rhubarb, and four of calomel. For the space of three months, prior to my cure of her, she had shewn no figns of menstruation, and the first return of that falutary fecretion was observed on the twenty-fixth of June; and on the twenty-fourth of the following month, it returned in a more copious manner; in a few days after this, her mind appeared less disturbed and confused, the symptoms gradually abated, she recovered her full mental powers, has been very regular ever fince, and continues perfectly well.

It is remarkable that, during the above course of cure, an eruption, somewhat similar to that which appears in the urticaria for nearly a fortnight, appeared every other day on the patient's face, arms, legs, and breasts, and at such times she was observed to be most calm and collected, and least subject to pain and heat.

## C A S E XI.

IT was with the most sensible degree of satisfaction, that, from a melancholy state, in which the functions of the mind were much injured, I was enabled to restore to his rational faculties

a most worthy and valuable member of fociety; he was in the thirty-ninth year of his age, had long applied to intenfe study and rigidly denied himself those relaxations, which a mind like his fo greatly flood in need of, as a temporary relief and refreshment from the immoderate fatigue of intellectual refearches; his original complaints were, flatulence of the abdomen, impaired taste, forgetfulness, pain in the chest with anxiety, tension in the left hypochondrium, indigestion of aliments. inquietude, watchfulness, a sensation of weight in the spine of the back, and a universal lassitude of the whole body. with a real debility of fystem. He had recourfe to a furgeon, in his neighbourhood, who bled him three times in the

space of fix days, and who informed me, that the blood was black, heavy, and grumous, separated but little ferum, of a greenish cast, and adhered to the fides of the bason; soon after the first bleeding, an emetic had been given. which, for fome little time, he thought of fervice, but, finding his usual pains and anxiety recur, he defired to have it repeated, which was complied with, and the next day all his complaints returned with redoubled violence, and to use his own expression, "he felt an anxiety and pain affest his heart;" extreme difficultv.of breathing enfuing, constrictions of the external parts, rigors, with laffitude and stupor, supervened, and a violent delirium came on; his mouth was distorted, he raved, was confined,

and my advice was thought necessary. I found the pulse full, strong and quick, the countenance flushed and inflated. and the eyes wild, fierce and protuberant; there feemed an indispensible indication for venæsection, and that, even usque ad deliquium animi; the blood appeared nearly in the fame state as before described; fomentations were frequently used to his feet and legs; a large velicatory was applied inter fcapulas, and, the following night, an antimonial emetic administered, which, operating kindly, the stupor was leffened; but, the pulse still continuing too full and strong, ten ounces of blood was again taken away: it was not fo black and grumous as before, there was more ferum, and of a better colour;

the camphire and nitre were next given, in equal quantities, and regularly continued twice a day; the blifter was kept open, the bleeding occafionally repeated, and, in the space of feventeen weeks, the patient, being thoroughly recovered, returned home. and has fince continued in good health. About a fortnight after giving the camphire, an eruption of fmall red fpots appeared on the cuticle, and continued feveral days, with an itching, and fome degree of heat.

## CASE XII.

IN the case of this patient, there had long been a complication of affections, from neglect at that period of life, to which the fex in general pay too little attention; she was naturally of a spare, thin, and relaxed habit, and had been fubject to copious discharges of the menstrual flux, a total cessation of which took place in the thirty-ninth year of her age; foon after which, she was attacked with inflammation of the eyes, and pain in the loins, translated to the head with a numbness in the hands. and finging in the ears; her ancles fwelled; she was subject to spasmodic affections in various parts of her body,

to jaundice, to a fixed redness in both cheeks, and to great inequality of spirits; by a proper course of medicine, in a few weeks, she recovered from most of those complaints, except the jaundice, which still continued with a general indolence and weariness of the whole body, a great depression of spirits, frequent fickness, and fighing. By the loss of a near relation, who died in May 1774, her condition became fuch as rendered it absolutely necessary to remove her, from her own habitation, to a fuitable recess for fuch whose derangement of mind renders fuch a measure necessary; in this situation, however, her disorder rather increased. than abated, till towards the end of the year for which they had engaged,

when it was thought proper, by her friends, to fend her to me. She appeared much emaciated, wasted with grief and continual vexation, and labouring under the usual symptoms of melancholy; her countenance was bloated and yellow; -her appetite depraved; the lids of her eyes were fwelled, their pupils very much contracted, and the whole fystem much distempered and relaxed: it was in December when she was placed under my direction, foon after which, an emetic of ipecacuanha was exhibited, which emptied the stomach of a great quantity of fordes, with which it had apparently been long overloaded; every third night, at bed-time, a stomachic purgative was administered; after four-

teen days the vomit was repeated, and the contents of the stomach were much less than before; the strength of the patient was recruited by a light nutritious diet, and, three times in a day, she took a cupful of a strong camphorated julep with ten grains of the powder of fquills in each dofe; and in this course, with little or no alteration, she continued till the latter end of August 1775, when, her mind being in a mild and fettled state, she returned home, and has ever fince enjoyed a tolerable good share of health, uninterrupted by mental infirmity of any long continuance.

## C A S E XIII.

MISS A. C. a young lady of a delicate habit, subject to nervous affections and painful menstruation, having, for some time, without any apparent cause, shewn evident signs of infanity, was, in the month of March 1776, placed under my care. She was naturally of a lively, active disposition, and remarkable for quickness of parts; under the influence of her delirium, she shewedgreat vivacity of imagination, and would very often express herself in well-adapted metre; though, when in her right fenses, she was never known to have any particular propenfity to it; she was for ever in motion,

and inceffantly pouring forth a rapid fuccession of ideas, which she ran through with a most amazing facility, feldom giving any rest to her fancy, either by day or night; she was habitually costive, and more particularly fo about the return of her menstrual period; she had long been much relaxed, and bracing and strengthening medicines had been ineffectually employed. I had, therefore, recourse to the austere and astringent vegetables; the oleum ricini was occasionally given her to remove her costiveness, which succeeded much better than any other aperient medicine she had tried before, and which might probably be attributed to the small degree of nausea created by taking of it, and the little tendency it has

to irritate the stomach and bowels; twenty drops of the elixir paregoricum was given her every night and morning, in a cupful of mint tea, from the beginning to the end of her menstruation; the camphorated julep, diluted with two ounces of water to four, was given her from April the fourth till the thirtieth of July following. On the feventh of August, at the desire of her friends, the was difmissed from my house, and has remained free from any symptoms of infanity from that time to the prefent, care having been always taken to alleviate the pains attendant on the menstrual paroxysm, by the soothing influence of an opiate. In Van Swieten's Commentaries, we are informed of a woman, who had been feveral times

maniacal, who, when her fits of infanity were upon her, always fpoke in metre, and had a wonderful facility at finding out rhimes; though, at other times, when in her right mind, she not only had no skill in this way, but had never so much as attempted any thing of the kind, having been used, from her youth, to get her livelihood by the labour of her hands, and being no ways remarkable for the quickness of her parts.

# C A S E XIV.

HAT a depravity in the habitual constitution of the mand will occasion a derangement of its ideas, even to madness itself, is a fact of such notoriety, that a very fmall acquaintance with those who labour under mental infirmities, will fufficiently evince its truth. From an habitual indulgence of pride, I shall relate an instance. which is not altogether extraneous, although it comes not into any curative point of relation but having baffled every medical effort of relief, will prove as a deduction to this beforementioned observation, and also an introduction to a curious case in point,

for which I am indebted to the pen of a correspondent, who, I believe, fometime afterwards gave it to the public through the channel of fome periodical print, but of this, I am not certain. The patient was a middleaged man, not tall but of an upright stature, remarkable for acrimony in his speech and answers, and for impatience in his manner and action; in his countenance he bore the traits of fuspicion, pride, and moroseness, and he was naturally of a contentious and irritable disposition; from an unexpected miscarriage in his commercial affairs, he became intolerably jealous, difrespectful to his family connexions, infolent and rude to every one who came in his way, intemperately passionate, and misanthropic to

the greatest degree; in this manner his infanity began to appear: he next drew upon his banker for fums immenfely beyond what his account would afford, and, when disappointed in this respect, he became fullen, and immediately made out drafts for enormous fums upon houses with which he had not the least connexion; these, and innumerable other actions, equally outré, fixed the imputation of his lunacy and determined his relations to feek for the lituation of which he stood in need; in this recess, he issued his mandates with all the arrogance and tyranny of an eastern despot, he would often draw upon the bank for ten and twenty thousand pounds at a time, with that degree of pomp and feriousness

as feemed to mark the reality of the transaction; he often insisted upon his being the Lord Chancellor, King of Spain, Duke of Bavaria, or some other great personage, and demanded reverence and respect accordingly; which, if not paid him immediately, he would become furly and outrageous, and iffue orders for the punishment of those who feemed remifs in their duty and obedience, and would feemingly rest fatisfied that his directions were punctually executed. He feldom expressed the fense of any bodily pains, nor was bleeding, bliftering, vomits, or any other evacuants of the least visible service to him; he was uniformly vain, formal, stately, gloomy, infolent, and felf-important; and at any time, however ridiculous

his words and actions appeared to others, they were supported in himself with all the dignity of excessive pride and oftentation, and an entire display of every vanity characteristic of that species of infanity under which he laboured; his imaginary greatness and felf-importance, however, gradually dwindled into a total decay as he approached to the verge of idiotifm, in which dark abyss I must leave him, to take a view of the communication referred to at the head of this case, its analogy to which, entitles it to a place, as an appendix not unfuitable upon this occasion. The writer premises his relation with observing, "That, in the long catalogue of infirmities to which human nature is subject, none is

esteemed more terrible, than that of madness or infanity; to be deprived of the quality which enables man to regulate his conduct, and even his defires, for his own preservation, is to be reduced below the level with the brute creation. This calamity, however, appears to the spectator even more terrible than it really is, for he judges of the feelings of the unfortunate person, by conceiving what himself, endowed with reason, would feel, if in his situation; and, by thus indulging an idea of what is impossible, and connecting reason with infanity, feels intensely for the mifery of the lunatic, whilst the latter is infenfible of any other uneafiness than what arises from the disappointment of his schemes, the bursting

of the airy bubbles formed by his over-heated imagination. Indeed, adds our relator, there are not wanting instances of such incoherences, so strange an affemblage of fense and madness. in some infane persons, that the beholder is forced to fmile, as well as compassionate; but the tear of pity flows not less fincerely because accompanied with the involuntary laugh: the following story will serve as a proof: - Some years ago, a poor man. who having studied the art of government and the balance of the European power with greater attention than his business, grew infane and fancied himself a king, and, in this situation, was admitted into the workhouse of St. Giles's in the fields, where there

then happened to be an idiot of nearly his own age; the imaginary king appointed the idiot his prime minister, befides which post, he officiated as his barber and menial fervant; he brought their common food, and flood behind his majesty whilst he dined, when he had permission to make his own repast. There would fit, the king upon an eminence, and his minister below him, for whole days, iffuing their precepts to their imaginary subjects; in this manner they lived about fix years, when, unfortunately, the minister, impelled by hunger, so far deviated from his line of allegiance, as to eat his breakfast before his fovereign appeared, which fo exasperated the king, that he flew upon him and would certainly have

put a period to his existence, if he had not been prevented; when his anger was thought to have abated, the minister was again introduced to his quondam fovereign, but he feized him immediately, and could never after be prevailed on to fee him. The degraded minister catched a fever in his exile, and when his majesty was beginning to relent, and almost prevailed upon to forgive him, he died; which had fuch an effect upon the fancied monarch, that, after living almost without fustenance, in a continued silence, a few weeks, he died of mere grief.— Ill-fated monarch! thou couldest not as can the illustrious monarch of the present day, if his minister were to " pay his tribute into the treasury to

which we must all be taxed," appoint another, who would guide the reins of empire with as much prudence and fuccess as the present one hath done: throughout thy whole territory there was not found one hardy enough to engage in the arduous task; and. equally unable to support the weight of government alone, as to descend to the peaceable, but unhonoured, vale of retirement, thou didst quietly yield up thy life and sceptre together! Perhaps it may afford some satisfaction to the reader, to be informed, that this anecdote is founded in fact, the name of the king having stood in the books of the parish, with the addition of "the lunatic king," for feveral years, the first entry being January 1st, 1727. Some-

thing of a fimilar instance of arrogant infanity we find in Wier de Præstig. Dæmon. lib. 13. de Lamiis, cap. 7. § 2. Operum, p. 180. and is in English as follows:—I knew an Italian, troubled with melancholy, who believed he was monarch and emperor of the whole world, and that he alone had a right to that appellation; in other respects he was quite rational, was eloquent, and did not labour under any other disease; at the same time he was wonderfully amused in composing verses in Italian, relative to the state of Christianity, to the differences and to the putting an end to the war which then existed between France and Holland, all which he delivered as fo many divine oracles. He every where made known his title by means of these letters, R. R. D. D. M. M. or Rex Regum Dominus Dominantium Monarcha Mundi, that is, King of Kings, Lord of Lords, and Monarch of the World. And Cœlus Aurelius, in his first book of Chronic Disorders, chapter the 5th, page 328, speaking of madness, says, "Thus one in his raving has imagined himself a God, another an orator, another a tragedian, or a comedian, another, carrying a straw in his hand, has imagined that he held the sceptre of the world."

## CASE XV.

A. N. aged thirty-one, of a bilious and plethoric habit, by great uneafiness and violent agitations of mind. became infane; she raved almost incesfantly, with short, and those not lucid, intervals; she would frequently pray, shout, laugh, scream and weep, and paid little or no attention to exterior objects around her; she had menstruated in smaller quantities than usual for three or four months before; her countenance was florid, her features diftorted, her eyes protuberant, brilliant and constantly moving, their lids were tumefied and inflamed, and the pupils much expanded; her voice was hoarfe

and hollow; she had great and extreme heat, and the pulse was hard, strong and quick; under these indications the lancet was freely used, and repeated to five times in the space of as many days, within which time she had lost upwards of feventy ounces of blood; between the operations, two antimonial emetics had been administered, and one draught, containing half an ounce of foluble tartar; and, notwithstanding the very small quantity of nourishment which she had taken for ten days past and repeated venæfection, the pulse continued uncommonly full and strong and her bodily strength was incredible; the infane fymptoms were not in the least mitigated; the blood had uniformly from

the first appeared of too dense a confistence, and, when cold, refembled melted fuet; nor was this appearance much more leffened in the last than in the first operation, so that a correction of the vicious construction of the humours was but little to be expected from venæsection; however, the depletion of the vessels had made way for attenuating medicines; lenient purgatives, at flated times, were repeatedly administered; and the camphorated julep, with a strong infusion of the Radix Raphani, was given three times a day for nearly fix weeks, when she began to have lucid intervals of three and four hours in the twentyfour; these intermissions, by a continuation in this method, with a fuitable

diet, were gradually prolonged to whole days and nights, till at length they became fo permanent, that, at the end of four months, she was able to return to her fervice, has continued well ever fince, is now married and the mother of a family.

#### C A S E XVI.

THE fon of a respectable and worthy magistrate in the city, had, in his feventeenth year, been fuddenly, and without any previous fymptoms, feized with a spasmodic complaint in his right arm, leg and lower jaw, with remitting pains on that fide of the thorax, which continued for fix weeks, without being in the least relieved by blifters, finapifms, electricity and antifpalmodics of various kinds. About the end of the feventh week from the beginning of the paroxyfm, for some days together, the contractions and pain were thought to abate, and, as the faintest ray of hope was followed with the eager expectations of a fond and indulgent parent, fo, in a few days after, when they recurred again in a more violent degree, attended with a partial paralysis of the tongue, which rendered the voice, at first, incapable of continued distinct articulation, and, afterwards, totally deficient, his feelings were rendered more intenfely keen; and, in this trying fituation, the best

and most approved medical advice and affistance was employed, but with fo little advantage, that, at the end of feventeen weeks, little or no alteration for the better could be perceived; he could neither write, read, nor speak, so as to be understood, and with difficulty received his food from the hand of an affiftant. On the feventh of September 1775, I received a sensible and well-written letter, defcribing the case with the nicest exactness, and soliciting my thoughts and opinion upon it; in my reply to this application, "I expressed my diffi-" dence of being ferviceable in the cafe, "but observed, as I had been thought "worthy of a confultation, if his re-" moval was practicable and confiftent

" with the inclination of his relations, "I defired to have him immediately " under my own care;" to which requifition they most obligingly acceded, and, on the 25th of the same month he was brought to me. He appeared to be naturally of an extenuated form and make, was much reduced by his illness, looked pale and wan, with a yellowish colour in his cheeks; he was totally deprived of speech, wasted and extremely weak, at times flightly convulsed, with a costiveness and nausea, and his intellects so much impaired as to impel him to behave and act in a very abfurd and ridiculous manner. A blifter, which for many weeks had been kept open between his shoulders, was suffered to dry up,

and on the fixth day after his removal. 'a feton was made in its room in the' direction of the spine; the joints of both arms were much enlarged and tumefied, leeches were applied to these parts, and afterwards warm attenuating cataplasms, until the tumesaction had entirely subsided; the vinum aloeticum alkalium, warmed with spirits of lavender, was used to keep the body in a proper state of laxity; and an apozem, of equal parts of camphorated julep and aqua pura, with two scruples of nitre and ten drachms of vinum antimoniale, was given in the quantity of three large spoonfuls thrice in a day, when the stomach was most empty. The feton discharged exceedingly well, and he so far recovered

his bodily strength, that, in less than two months after he came to me, he was able to amuse himself upon the violin, which, before his illness, had been his favorite instrument of music. and in a little time, was able to hold a literary correspondence with his father. Replete with gratitude to myfelf and family, and being thoroughly recovered in health and spirits, at the end of fix months he returned home, has continued well ever fince, and is now capable of carrying on the business, to which he has been admitted a partner, with the most regular attention and confisence.

#### C A S E XVII.

A Young man, naturally of a fanguine and robust constitution, yet of feeble intellectual faculties, after drinking to excefs, had his body covered with phlogistical blotches, which, by using the usual means, were after some time thrown in and, as they disappeared, he was observed to become more dull. heavy and pensive than usual; he complained of an obtuse pain in the cheft, and a fwelling and tenfion in the region of the heart, for which he was bliftered, loft blood, and took fome purgative medicines, but found no relief at all from any thing that was done; he had restless nights,

flept little, was subject to rigors, with lassitude and stupor, was very little feverish, and had given many instances of an infane state of mind. On the eleventh of May 1778, he was entrusted to my care; he appeared under much anxiety, his aspect was wild, his countenance florid, there was a redness and inflammation in the tunica albuginea of the eyes, whiteness of the tongue, a difficulty of deglutition, he complained of the head-ach, was thirsty, hot, and had but little appetite; the pulse was strong, hard and above the natural standard, and he had not been at stool for many days; these symptoms were accompanied with distressed thoughts and a frantic manner of behaviour; the in-

dications of a febrile inflammatory disease being thus evident, venæsection was used, and the discharge of twenty ounces of blood not being fufficient to bring on a deliquium, the quantity was increased to nearly thirty. which fully effected that purpose: the complexion of the blood afforded little or no information; an emetic was administered on the day after the operation, and repeated at the distance of five or fix days for three times, and on the intermediate days the following draught,

R. Tartar. Solubic. 3iij.

Mannæ 3 ss. solve in

Aq. Fontan \( \bar{z} \) ij. Aq. Cin. ten \( \bar{z} \) is. m. f. haustus.

But, although the bodily fymptoms were much relieved by this treatment and the pulse confiderably lowered, the functions of his mind were yet much impaired, and he continucd in a kind of torpid state till towards the end of the fourth month, when, after the free use of the camphorated julep and Tinctura Fuliginis. he began to recover his reason, and, for fix days together, there were hopes of its continuing; but a relapse followed, and his maniacal fymptoms recurring, it was not till nearly a month afterwards, that a second lucid interval took place, when, an eruption of minute pustules, refembling the itch, broke out on his arms, hands, neck and breast, from which time he

92 CASES OF INSANITY, &c.

continued to mend, without any relapse at all, till he was able to return home and follow his usual occupation.

#### C A S E XVIII.

MARY, the wife of John Ingram, of Chipstead, in this county, had the misfortune to catch cold in her lying in of her third child, which brought on extraordinary commotions in the body, and terminated in actual infanity; she was furious, restless, turbulent and raved incessantly; her body was costive, her pulse quick and hard, her eyes distorted and instance, her

tongue rough and parched, without thirst, her skin harsh and hot, and her countenance red and bloated; it was with difficulty she was restrained from doing any mischief to herself or others, and, after continuing some weeks in this state, it was concluded by her friends to confult me. I found upon enquiry, that the lochia during their period of evacuation, had been but fmall, she had secreted but little milk, and had not perspired since her lying in: fome medical affishance had been ineffectually administered, and, being in indigent circumstances, she had been too much exposed to that idle curiofity which the vulgar too often exercise in these unhappy cases, to the extreme aggravation of the delirious fufferer

and to the shame of every tender emotion of humanity. As circumstances would not allow of her removal from her own habitation, the first thing advised, was, proper restraints over her person, an affishant to direct them accordingly, and a strong injunction that all impertinent visitors should be totally excluded from the sight of her; a proper quantity of blood was taken away, the texture of it was sizy and the ferum yellow and turbid, and the sollowing emulsion was then prescribed,

hora donec fatis purgaverit.

A feton was made between the shoulders in the direction of the sp ne, which, after a few days, began to discharge in a very copious manner; as the emulsion was not found quite strong enough to answer the purpose, six drachms of the soluble tartar, with an addition of half an ounce of manna dissolved in water, was given her every third day for six times, and the sollowing apozem and drops took place on the intermediate days,

A spare regimen, with a total abstinence from animal food, was advised, and diluting drinks; in a few days the poor woman was much calmer, got fome refreshing rest of nights, accompanied with gentle fweats, and, in feven weeks time, the cortex being found necessary as a tonic, the cure was finished. It is somewhat remarkable, that the menses did not return for two months after her recovery, although, before this illness, she had always been very regular, and when that period did return, she was for fometime after troubled with nervous affections, which, by the affiftance of the cortex and valerian, were foon fubdued and her health thoroughly reflored.

## C A S E XIX.

THE subject of the following recital, was a poor woman of the name of BROOKER, in the thirty-fifth year of her age; she had borne three children, and, in the lying-in of the last, from fome improper treatment, was attacked with rigor, with fickness and vomiting; she had complained of an acute pain in the head and in the region of the womb, with some degree of tumour, heat and tension; she had taken a vomit and used some other means. notwithstanding which, her complaints continued to fuch a degree, as flightly to affect her intellects, but, without any farther medical affistance, her

complaints at this time gradually wore off of themselves, and she remained pretty well for some weeks afterwards, when the pains, heat, tension and vomiting fuddenly recurred, and she became possessed of absurd and whimfical fancies, suspicions and fears, attended with vociferation and flight ravings, in which state she was configned to my care. Evacuations by stool and antiphlogistic medicines were tried without effect, the pediluvium and an emetic were next thought of, from the former she received much relief. but, although the stomach was foul and she threw up a great quantity of bile. the pain in her head was much increafed by its operation; her diet being regulated, according to the indications

of the case, a blister was kept open between her shoulders, and the camphorated julep and common emulfion, with the fœtid volatile spirits were given her at bed-time, and also three times a day when the stomach was most empty, the good effects of which were never more apparent. The maniacal fymptoms gradually abated, and, in two months time, the patient being in every respect recovered, except a nervous weakness, for which the usual remedies were advised, was dismissed from my house, and has remained in better health than she had enjoyed for some years before, without the 'least return of her disorder.

SCHOOL OF MEDICINE

#### C A S E XX.

H. G. a native of Folkstone, had, from the time of the ceffation of her menses, which occurred foon after she had turned of her forty-fifth year, been flightly affected in her fenses; fhe was rather of a fanguine habit, had lived well and been accustomed to copious evacuations; the menfes ceafed very fuddenly and she suffered much from plenitude; for, besides the effects this ceffation produced upon her intellects, she was attacked with the piles to a great degree, had fugitive spasms in her arms and legs, was costive, had a deafness with a sense of weight in the fore part of her head, frequently an obstruct-

ed deglutition and an universal erysipelas, attended with an acute fever, which for some time threatened her life, and it was feveral weeks before the was thought to be out of danger. About twelve months after her recovery from this illness, without any apparent cause and after a flight head-ach, she was attacked with an Hamorrhagia uterina to fo excessive a degree, that her life was again despaired of, and, it was not till after fix weeks from its commencement that the flux was totally checked; after which, the folids were strengthened with tonics, she recovered her bodily strength, but, from that period, became obviously more deranged in her senses than ever she had been before. In the month of April 1776,

eleven months after the diforder above fpoken of, I was confulted by her relations, who foon afterwards refigned her entirely to my care; fhe was flighty and inconfiftent; in the day-time talkative and loud, penfive, crying and melancholy, or as the poet finely deficibes it,

- " In moody madnefs laughing wild
- " Amid severest woe."

And in the night-time noify, turbulent and watchful; the remains of a good constitution were very visible, and as the state of the blood justified bleeding, eight ounces of blood were taken from her arm on the third day after her admission to my house; the sizy inspissation of the blood induced me to put her under a course of the volatile

and neutral falts, with now and then a lenient purgative, as occasion required. From a mistaken tenderness she had been intemperately indulged, as it will too often happen that, where the patient has been used to command, to obey is generally done with much reluctance, and, although reason no longer discriminates between right and wrong, proper and improper, yet the friends and relations too feldom interpose in these cases till mischief arises from the omission, by the unruly violence of the disorder, or the patient is prejudiced by indulgencies, which are fubstituted instead of restraints; this had been exemplified in the present case, for scarcely any thing, either to eat or drink, which she had asked for, had ever

been denied her; and to suppress her defires, however inordinate and extravagant, would have been thought a neglect of duty in those about her, fo very abfurd are, in general, the ideas of relative attention, when extended to persons under the pressure of mental diforders; and this woman had manifestly been made worse by cordials. wine, visitors and a plentiful diet, from all of which it was now become abfolutely necessary, that she should rigorously abstain, as the only probable chance to remove the cause, and enable her in some degree to recover her senses. A cool and sparing diet was enjoined her, a feton fixed between the shoulders in my usual direction; a purging draught of glauber falts and manna

was given every third day, and, on the intermediate ones, the camphorated julep, in proper proportions, three times in the four and twenty hours, and, after fome time, she became evidently better both in body and mind; after this, however, she was suddenly seized with rigors, nausea and thirst, which terminated in an intermitting fever, for which we had recourse to emetics and the cortex. and every usual method adapted to the different indications which enfued. till the complaint degenerated into an acute continual fever, which, by phlebotomy and antiphlogistic remedies was foon reduced to its former type, when the bark and nitre, in conjunction, were administered for some days, till the patient was in a convalescent

state. During the whole time of her illness she had never once been delirious, and, as her intellectual faculties were at best but feeble and limited, the share of reason which she now posfessed, though not in any elevated degree, was thought a fufficient inducement to her relations to remove her to her own home, where, for some months, she was subject to a slow nervous fever, but continued free from the return of any maniacal fymptoms till the time of her death, which happened about a year afterwards.

### C A S E XXI.

M. P. a lady of a constitution naturally scorbutic, soon after a critical change of life, which happened in her forty-eighth year, was feized with spasmodic affections in various parts of her body, great anxiety, dejection. fwelled ancles, faintings, and a difficulty of breathing; by proper medical affistance she was in a great measure relieved from these complaints, but, her intellectual faculties, which had before been susceptible of gentle, delicate and tender affections, were foon afterwards discovered to be much impaired and deranged; at first she was perpetually pensive and thoughtful,

and afterwards, without any regard to decency, she talked incessantly, or raved, first on one subject and then on another, in fudden transition; as different images struck her imagination; The had feldom any appetite, and would fometimes with obstinacy totally abstain both from meat and drink, with a view, as she declared, to starve herfelf; but this resolution lost its force after two or three days fevere abstinence, and she would take any kind of nourishment that was left within her reach, but never either eat or drank before any one, and always denied that she had had any food, although, when left, it was very plain that no one but herfelf could possibly have difensed with it, and after she had retracted the idea of destroying herself by starving, she seemed as obstinately bent upon destroying herself by some other means, which she would easily have effected in some way or other had not the most strict guard been always fet over her. When I first saw her, I think there never was a countenance more deeply impressed with grief, horror and melancholy; her breath was fœtid, she had livid, and in many places, particularly on her legs, large black spots; her feet and ancles were fwelled, her countenance was bloated and fallow, there was a general weakness of the whole body, her tongue was white and rough, she had a redness about her nostrils and eye-lids, her skin was squalid and dry,

and although she did not complain of thirst, by the eager manner in which the drank, it was very obviously fo; fhe fpoke quick and incoherently, had made but little urine for some days past, had not perspired in the least and was very costive. A very long uninteresting and historical detail of her case was given me by her husband, and, although it appears unnecessary to follow him through every particular of his narrative, yet I shall take the liberty to remark, that, from his own testimony, many parts of his conduct in regard to the unhappy fufferer, appeared to the greatest degree reprehensible, justified some reports which had been propagated to his difadvantage, and

which, if faithfully repeated, would

reflect but little credit on his conjugal feelings; but, as remarks of this kind are not within the circle of my present defign, I shall return to the melancholy object of my recital, who had been removed from a moist to a dry pure air, and was now wholly under my care and direction. That the folids and fluids were affected by the scorbutic taint, was evident in full point of view; therefore, the antiscorbutic juices, with antiseptics, were employed to good effect, and the excretions, both by perspiration, urine and stool, were promoted; her nights were foothed by fifteen grains of the saponaceous pill, which had also the good effect to pacify her in the day-time; her diet, in general, was of eafy digestion and con-

fifted chiefly of a due mixture of animal and vegetable fubstances; by this process, in about fix weeks time, the patient had a very different countenance and was much relieved in her intellects, but the remembrance of former troubles feemed to rankle in her mind, and although she spoke with confishency and endeavoured to conceal it, yet the latent thorn of heartfelt woe was not unperceivable; the regimen and medicines were continued till the end of four months, when, as the putrefactive diathefis of the fluids feemed fufficiently corrected, we had recourse to chalybeates and the cold bath, by which means the cure both of her body and mind appearing for the present in a great measure effected, the

patient was refcued from the grave and restored to her family. I say for the present, because, in a sew months after, by ungentle treatment and shame ful neglect, she suffered a relapse, which terminated in suicism.

# C A S E XXII.

In the beginning of the year 1777, Mrs. E. about forty-two years of age, was feized with a rigor, with reftlesseness, lassitude and pain in the loins; to these symptoms succeeded internal excessive heat, with great thirst and an eruption of the erysipelatous kind all over the face, neck and breast, which,

after a few days, were subdued by the antiphlogistic plan; but an alienation of the mind took place, and the patient talked and imagined improbable things with much fear and distress of imagination, which induced her relations to fend her for advice and affiftance to London, where, after continuing four months under the care of an eminent physician, she returned home apparently much relieved, and without the least fymptom of maniacal affection. But, in the autumn following, she was attacked with an intermitting fever, which was, at that time, very frequent in the neighbourhood where she lived; her complaint, however, was attributed to the total cessation of her menses, the evacuation of which had never been

very confiderable, but had now ceafed for four months; she complained of pain and tension of the tonsils, with loss of strength and sensibility, and great anxiety, all which fymptoms had been much aggravated by the officious zeal and instructions of one of her own fex, who confidered it as religiously neceffary, that she should take Hierapicra steeped in gin, and that frequently; an indifcriminate practice with women in general, and to which persons of irritable constitutions frequently fall victims: a violent inflammation of the tonfils, an eryfipelas and the piles fucceeded, but with little or no delirium, or any apparent distress of mind. At this period, I was confulted, and finding a full hard pulse, heat and the

other fymptoms described, contrary to the opinion or approbation of the patient and the practitioner, who had before been employed, took away fix ounces of blood from her arm, which, with the help of nitrous medicines and gentle laxatives, in a few days relieved the patient in every respect, except the intermitting fever, which continued regular, but which foon gave way to a decoction of the bark and nitre; and now the patient relapfed into her former dejection and distress of mind, and it became necessary to place her more immediately under my care. She was costive, sick at her stomach, very yellow in the face and hysterical; an emetic was given her, which brought off from her stomach a very great

quantity of bile; magnefia and fulphur were combined as a constant remedy for her costiveness, the warm pediluvium was used every night and morning, she was kept quiet, her diet was light and nutritive, an iffue was opened in her leg, and in a few weeks the was reflored to the full possession of all her mental faculties, which she has retained uninterruptedly ever fince. but the nervous influence had been for much impaired by her disorder, that the is still troubled with affections of the nerves, and is at times subject to flight pains in her head and stomach.

which of wind to court

## C A S E XXIII.

MRS. E. H. of a florid complexion, full habit, and about the age of fortyeight, had, for some time past, paid so strict an attention to a favourite system of religion, which, like a kind of epidemic contagion, has long spread its baneful influence through fo many ranks of people, to the excitement of the most daring outrages and wildest extravagancies, that at length she became insane. And if it be true, that instances of infanity, are at this day more numerous in this kingdom, than they were at any former period, we have great reason, not only to attribute the cause to the present universal diffufion of wealth and luxury through almost

every part of the island, but also to support the opinion, that so humiliating a degradation of our reasoning faculties owes much o its accession to the absurd tenets and ill-founded notions of an epidemic enthusiasm, whose type is absurd and gloomy notions of God and religion derived from vulgar prejudices, which excites the attention of weak understandings to points of religion, which they contemplate without comprehending, to the entire subversion of their rational faculties, within which description was the unfortunate lady of whom I speak: religious objects had so far gained the ascendant of her mind, as to impel her to words and actions of the most maniacal kind, and she had imbibed a fixed belief of the manifestation and

interference of the Deity in her behalf, although her conduct was ever fo reproachable or criminal. In this dangerous state of fanaticism. she was fubmitted to my care; she had been used to a pretty liberal table, and, as abstemiousness had not been in the number of her avocations to falvation. fhe had indulged pretty freely in the use of spirits and malt liquors; a total suppression of the menstrual evacuation had, I was informed, taken place about two years prior to my acquaintance with her case, when, by the judicious treatment of her apothecary, she had experienced but very little interruption of health from a critical period, often pregnant with danger, and to which many an amiable woman, for want of

proper advice and direction, has fallen a victim. In my curative plan, if it be asked why I considered depletion as a necessary appendix, having apparently no bodily complaint to contend with, I answer, that it is ever a proper rule to be enjoined, when the vessels appear fuller of humours than what are agreeable to a natural state of health; besides, in this case, the manner of her living had obvioufly ferved to inflame and exalt her mind to a greater pitch of enthusiastic madness than it otherwise would have been. which was manifested in less than two months after she had been reduced to a scale of abstemiousness, had been twice bled, and taken five doses of soluble tartar at fuitable intervals; for, as the

blood flowed in a cooler channel, her wild antics and religious fervor and frantic declamations began to abate, and, as no one of her religious fectaries were admitted to see her, and no one suffered to speak to her or to pay the least attention to her extatic reveries, or enthufiaftic raptures, they gradually loft their feat in her mind, and, at the end of eight months, seemed entirely annihilated; and the state of her mind being confishent and rational, at the end of twelve months she returned home to her family, who carefully guarded against her relapse by a total prohibition

of the zealous devotees to whom she

owed the first impressions of her dis-

order.

### C A S E XXIV.

MISS A. S. who had always been remarkably healthy, one evening, after over-heating herfelf, imprudently took a large draught of cold water and fat down upon a cold feat in the open air; early the next morning she was taken with a pain in the head and back, with rigors, restlessness, and intense heat: after which, she became speechless and lost her fenses; the family physician was immediately confulted, and, by bleeding, bliftering and proper remedies, in a few days she was brought to herself, but the attack was too severe to be entirely fubdued, and it left a train of nervous complaints, the

enumeration of which is needless. About the usual time of her menstruation she complained of violent pain in her head, loins, back and legs, with pain and palpitation about the navel; and foon afterwards began to shew many antic tricks and gestures, displayed an uncommon propenfity to talk, and was bewildered with fo many strange whims and fancies, as to leave no doubt of the brain being in a difordered state; the period abovementioned was passed over without its usual falutary effects, nor could all the advice and management in the power of her friends to procure, relieve or affift her; she continued in this state near feven months, at the end of which, I received her into my house as a patient.

The disease itself appeared obviously to have been the consequence of a contraction in the uterine vessels, from cold; to relieve and relax the parts, the steams of warm water, as well as the warm pediluvium, were used for nearly five weeks before they had the desired effect; the internal medicine, employed on this occasion, was, as follows:

R. Calomel. gr. iij.

Extract Sabin. gr. iiij.

Syr. papaver. errat. q. s. ut hat Bol. omni tertia Nocte h. s. superbibend.

Infusi Radiciis Raphani poculum & Ibidem repetatur ter in Deibus intermediis.

Upon this plan we had not proceeded longer than the time before-mentioned. 126 CASES OF INSANITY, &c.

when the Catamenia returned, her ideas became less deranged, and she gradually recovered the use of her reason; which, by proper care and attention to the menstrual periods, she has ever since retained.

### CASE XXV.

THE epidemic catarrh, more generally known by the name of the Influenza, which raged with such violence in different parts of the kingdom in the year 1782, prevailed almost universally among the inhabitants of a town, where the patient, of whom I am now about to speak, was one of the number of

the fick; there was fomething extraordinary in her case from the first attack, a strange alteration in her conduct and behaviour, with a flight alienation of mind and depravity of judgment, were observed to accompany the common symptoms of the disorder; she had a fever, with an acute pain in her head and pit of her stomach, with total loss of appetite, and almost a continual mincturation; her respiration was short and somewhat difficult, she had a short. dry and flight cough without expectoration, pinching pains in her bowels. attended with a diarrhæa; she had also a palpitation of the heart, with pain, anxiety and frequent fainting; she was bled, had small doses of antimonial powders, chiefly composed of tartar

emetic; the spiritus mindereri was administered, and the case treated with every degree of medical skill and perspicuity: on a remission of the febrile fymptoms the cortex was used, but not proving effectual, and great lowness of spirits and the cough continuing, recourse was had to chalybeates and ballamic medicines, from which she derived much good effect; but her mind was not clear and collected, and at intervals flight and transient deviations from reason were observed for some months, till at length, the fymptoms of infanity were confirmed by deranged and confounded ideas, ridiculous averfions, unreasonable marks of disgust; hatred, fear, distress and terror succeeded, and became a patient to me

in the beginning of August 1783; her menses for fix months before had recurred in much smaller quantities than usual, her eyes were dull and heavy, their lids fwelled and flightly inflamed, the pupils unufually distended, and her countenance was pale and fickly; the talked much and incoherently, and bestowed but little attention to the objects around her; besides the cough which still continued, she breathed with some degree of pain and uneasiness, and had several yellow spots in different parts of her body; pain and anxiety had wasted her very greatly, and, for a time, prior to that in which she came to me, she had got but very little fleep—the humours appeared to be in the most vitiated state. Her

complaints had for some time been confidered as arifing from the fcurvy, for which she had drank plentifully of a decoction of the water-dock, and used other means but without any relief; her regimen had not been properly regulated, she had been too much indulged in drinking fuch liquors, as rather had a tendency to increase her diforder than otherwife, and the place she had lived in was of too moist an air and a temperament inclining to the adust; her diet was now made chiefly to confist of vegetable substances and milk, and her general drink was small white wine whey; to promote the excretions by the skin and urine, the fal diureticus and athiops vegetabilis took an equal share, and, by invariably pursuing this plan for the space of five and twenty weeks, the patient was restored to her pristine health and mental consistency, and has remained well to this present time.

## C A S E XXVI.

In the year 1776 the parish officers of Friendsbury applied to me for my advice in regard to a maniacal man patient they had confined in their workhouse; this unhappy object had been very desperate and committed many acts of violence before they could secure him, which they had now effected in a very extraordinary manner; he was secured to the floor by means of a

staple and an iron ring, which was faftened to a pair of fetters about his legs, and he was hand-cuffed; the place of his confinement was a large lower room, occasionally made use of as a kitchen, and which opened into the fireet, there were wooden bars to the windows, through the spaces of which continual visitors were pointing at, ridiculing and irritating the patient, who was thus made a spectacle of public sport, and, by several feats of dexterity, fuch as threading a needle with his toes, and many other strange and uncouth tricks and antics, he had fo far attracted the notice of the neighbours, that he was feldom without a croud of idle spectators at the door and windows, and frequently from the

hands of this unthinking group obtained beer, gin, and other liquors, which ferved to aggravate, inflame and to keep him in a continual ferment and agitation; I was requested to take him home immediately under my own charge; but, as the poor wretch was in a violent frantic state, and that in a great measure occasioned by the impropriety of his fituation, my advice was to take off his shackles and secure him in a strong strait waistcoat, either made of leather or the strongest ticking; but, as I was informed this kind of fecurity had been tried and found ineffectual to the purpose, by his gnawing holes in the shoulders and by that means getting his arms loofe and the waiftcoat off. I gave directions to have those parts of

them, which immediately covered the shoulders, quilted over on some sheet lead with wire thread, and to keep the external parts continually moistened with a brush dipped into a solution of aloes; it was my advice also, to build him a fmall hovel at a distance in the most retired parts of the premises belonging to the workhouse, and to strictly prohibit any one from going near him, or converfing with him, upon any account whatfoever, except fuch, who should be appointed to watch and attend him; besides this, I directed the apothecary to bleed him, give him an emetic, and to keep his body cool and open with

half an ounce of soluble tartar repeated-

ly, as occasion might require. These in-

structions, with proper attentions to his

person and diet, were punctually carried

into immediate execution; and, in a few weeks the patient entirely recovered his reason, and quietly and regularly returned to his employment as a husbandman, and I have not heard of his having had any relapse since that time.

#### C A S E XXVII.

FROM some original fault in the constitution, the subject of the subsequent case, had, from her infancy been subject to cutaneous diseases; this affection of the skin was partial, sometimes patches or spots of an irregular appearance, and chiefly of a dark colour had appeared in some parts of the body and

fometimes on others, and were always attended with a great degree of heat and itching, and she had more than once been removed from school upon the fupposition that these breakings out were infectious. When I first faw these blotches, she had several of them upon her arms, legs, face and neck, those on the latter parts had fomewhat the refemblance of a raspberry or mulberry, and those on the former were mostly of a whitish colour, scaly, dry and rough; mercurial and antimonial medicines had been given her for some time by a regular practitioner, but they ferved only as palliatives, and the diforder. disappeared and recurred so often, that at length recourse was unfortunately had to an itinerant Empiric, and for

some weeks he had the credit of having wrought a most miraculous cure; but unhappily for the poor patient, much mischief lurked under this slattering appearance, for, on a fudden, her imagination was disturbed, and a strange alteration was perceived in her manner and behaviour; the first figns of her alienation of mind were discovered about the usual return of her Catamenia, she was at first furious and audacious, afterwards pensive, dejected and timorous; she complained of pain in her forehead, pharynx, neck and Scrobiculus Cordis, which continued violent and without intermission; her countenance was gloomy and overcast with forrow, her eyes wild and diftorted, their pupils much delated, and

her face fallow and cachectic; she was bled, had one blifter between the shoulders, and another at the pit of the stomach; the pulse was hard and fmall, the respiration deep and flow, she apparently grew worse, refused all kinds of food, and shewed an obstinate propenfity to fuicide, from which she was with difficulty restrained. In this state of the case I was first consulted: ten weeks had now elapsed fince the last return of her Catamenia, every thing she said or did betrayed the most violent agitation of mind, which it was not in her own power to correct; she was always intent upon one and the fame thought, delirious without a fever, and fully determined upon her own destruction if she had had it in her

own power fo to do: it was therefore highly incumbent upon those about her, to exert the utmost vigilance and care to prevent it. To dissolve and attenuate the thick glutinous crass of the blood and humours, the foluble tartar was given in the quantity of three drachms every fecond or third day; a thin diet and diluting drinks were ordered, with the use of the warm bath every night and morning; a feton was made between the shoulders, and, to recover the menstrual evacuation, a teaspoonful of the Tinet. Mart. in Sp. Sal. and Elixir Aloeticum in a cupful of the Decoctum Raphani, was given every morning at eleven, and afternoon at five o'clock; and every night at bedtime a small draught of the camphorated

julep with ten drops of elixir paregoricum was given her, which meafures being continued for a few days, she began to pass easier nights, and, in little more than five weeks, the menses returned, her appetite was reflored, and her countenance, from gloomy and contracted, became more open and eafy, the eruption to which she had before been subject, made its appearance again on her forehead, cheeks and breafts, but of a more florid hue than usual, and, having recovered her reason, was unwilling to make farther trial to cure an eruption which feemed inherent to a constitution from which it had proved fo dangerous to expel it.

#### C A S E XXVIII.

SUNK into a deep melancholy, which had produced an universal muscular decay, Mr. B. B. was put under my care in the month of July 1777; his eyes were bright, full and protuberant, he was subject to flatulencies in the abdomen, his anxiety was inexpreffible, his appetite was fometimes totally lost and depraved, and at other times unnatural and increased, his aspect was grim and gloomy, he had much constipation in the bowels, his breath was hot and offensive, he was furly, morofe and dogmatical in his carriage and behaviour, his eye-lids were puffed up and fwelled, at times

he was very unruly, restless and turbulent, and he had an aggregate eruption. fomething like the herpes miliaris. which extended all over the back, neck, face and arms; his pulse was quick, strong and hard, with preternatural heat, and his urine was very high-coloured. As but very little attention had been paid to his diet, it was now regulated upon a plan that was at once cooling, light and nourishing, at the same time, that the liquors which he had been used to were allowed him in a less liberal manner than they had been for some time past; the foluble tartar was given him, occafionally, as a gentle laxative, and, as he daily got better, recovered his flesh and spirits in sour months, after enjoying a lucid interval of some weeks, he was judged by his relations to be well enough to return home, the confequence of which was, a relapfe, and he was brought back to me again in less than fix weeks, when I had the fame ground to go over again as I had before, and, in a few months, was equally fuccessful; when, at the pressing instance of his relations, another trial was proposed and made, the consequence of which, as it might reafonably have been expected, was a fecond relapse, with this difference however, that I totally disclaimed having any thing farther to do in a cafe where the friends of the patient had themselves so little reason and consideration on their fides, and the unfor-

tunate man, I was informed, was fent to St. Luke's, where he died foon after his admission. This case furnishes another to the numerous proofs I could deduce from the practice of a feries of years, to demonstrate the inutility and impropriety of removing the convalescent Maniac too soon to his former fituation, the least favourable of any to the re-establishment of weakened and relaxed intellects; domestic concerns and particular circumstances of business too hastily present themselves to his imagination, not fufficiently strong and collected to bear the impressions, and digest the influence of those ideal affociations, naturally attached to fuch fituations; the animal

- CAC I III NO I J. FIEL

fpirits are hurried, the mind deranged, and a relapse of the most dangerous consequence too often ensues.

## C A S E XXIX.

F. B. in the feventeenth year of her age, had the misfortune to lofe a very near relation, which so deeply affected her mind as to throw her into an acute continual fever, in which she was delirious and raving; a blister had been applied to the head, stimulating applications to her feet, evacuants and antiphlogistic medicines had been used; and she had scarcely recovered from the fever, when she broke out into a peevish, angry, discontented

mode of behaviour, very far from her natural manner and disposition; she would often throw-herfelf into violent fits of groundless rage, and was almost ever flaming with refentment against those about her. Thus noify, vindictive and contentious, she was disposed to every kind of mischief which violence and despair could urge her to; and on this account, for the fecurity of herfelf alfil others, it was thought requifite to fecure her in the usual manner: in this flate, fle almost continually raved, menaced, screamed, Twore, or replied with the most vehement anger to all about her, infomuch, that, wearied out and fired with the notife and trouble the created, The was committed to my charge. I found the had an ableefs in

the back part of her neck, with figns of coction; her appetite was depraved; the abdomen was tense and hard, probably from the long constipation she had endured, which had been for the space of ten days, so that, it might be reasonably supposed, the putrid contents of the labdomen had generated a great quantity of elastic air; she had frequently spalmodic contractions of the joints, with convulsions of the whole frame and violent periodical pains; her deglutition was difficult, the discharged her urine involuntarily, the had frequent eructations, her eyes were inflamed, her face was contracted, she had great heat equally over the whole body, she had a hoarseness, with a peculiar hollow and difmal voice,

the cuticle was tinged with a yellow die, and she had often a palpitation of the heart, attended with pain and extreme anxiety. To remove her obstinate coftiveness, an emollient clyster was administered, but, not having the defired effect, one of a more stimulative nature was injected and answered the defired purpose; I then gave her an emetic, which brought off a great quantity of crude bile; a seton was made between her shoulders in the direction of the spine. and below the basis of the abscess: she was occasionally purged with soluble tartar, and thirty drops of the Tinctura Fuliginis were given her, three times in a day, in a cupful of the camphorated julep. Due attention was paid to her diet, and in this method she persevered

for nearly the space of four months, when her health and reason being entirely re-established, she returned to her friends, and I have never heard that she has since had the least return of infanity, although the seton has been dried up and all kind of medicine long since laid aside.

## C A S E XXX.

A LADY of the most distinguished literary eminence, and who will most obligingly, at all times, be ready to bear testimony to the truth of these premises, applied to me on the 5th of March 1779, concerning her brother, a dignissed cler-

#### 150 CASES OF INSANITY, &c.

gyman in this county, who, for about twelve months before, had laboured under a deprivation of his speech and fenses, icterical affections and nervous debility. He had been attended by a physician and an apothecary from the first beginning of his complaint; he was about eight-and-forty years of age, had once, in the earlier part of his life, been attacked with the gout in his feet, and, for fome time before he became fo very bad, had laboured under fymptoms of indigestion, complained of obtuse pain in the left hypochondrium under the left short ribs, sometimes in the region of the heart, extending to the loins and bladder, and frequently recurring with pains in the head and neck, flomach and bowels, accompanied with almost

a continual nausea and acid eructations, for which he had taken an emetic, and, becoming partially relieved, stomachic medicines and warm purgatives had been given. It was conjectured that the symptoms he laboured under, were occasioned by the gout; and, in consequence of this opinion, the proper methods had been purfued to bring on a paroxyfm of that disorder, but this not being effected, and no substantial benefit being derived from this treatment, saponaceous and aloetic medicines succeeded; from which, for some short time, it was thought the patient received relief; but all the fymptoms, with some additional ones, recurring to a greater degree than ever, I was defired to vifit him and give my

opinion of the case to his relations; he was then at a village in the vicinity of the metropolis, attended by two affistants, who never left him by day or night. From the gentleman of the house where he boarded, I received the following relation, "That he never offered "to drefs or undrefs himfelf, that he " would not eat without being fed like " a child, that he would fit whole days " together with his eyes rivetted to the " ground, that he fometimes appeared " dejected and timorous, and, at others, " fo furious in his gestures and man-"ner, as to render the strait waist-" coat absolutely necessary; that his " eyes were in general heavy and fixed, " their coats tinctured with yellow and " often looked red and inflamed, that he " was subject to troublesome flatulencies,

"inexpressibly anxious in the day-time " and restless of nights, but never utter-" ed a word; that he was costive, often " fetched deep fighs and drew his breath " with difficulty; had fometimes a flush-"ing in his cheeks, at others, a livid co-"lour, with a dull, grim and stupid aspect, " with fudden flarts and fhaking of the "whole body, and that his excrements, " in general, were round, hard and red, " and fometimes covered with yellow " bile; that if spoken to, he appeared in a "ftate of torpidity, his eye-lids were puf-" fed, and, in fitting, he inclined to the " right fide as if he felt pain in the left hy-" pochondrium, which, upon examination. " felt hard and tense; and that a yellow-"ness was diffused over the whole surface " of the body, which would often almost

"totally disappear for four or five days or "aweek at a time and then appear again," a circumstance not very uncommon in hypochondriacal and maniacal cases. To this account was added, "that his " urine was made in small quantities, at " long intervals, appeared to be passed "with difficulty, and was, in general " thin, limpid and pale, nor had ever " any fediment been observed in it at " any time, but once, which was foon " after the operation of an emetic, and it " was then faid to be loaded with bile;" the pulse was hard, strong, quick and full, he appeared of a truly atrabilious habit, and as fenfeless as a statue: under the influence of this fullen taciturnity, his figure and fituation reminded me of those truly beautiful lines of the poet's, descriptive of a melancholy maniac:

When, gloomy, the black bile prevails,
And lumpish phlegm the thicken'd mass congeals,
All lifeless then is the poor patient found,
And sits for ever moping on the ground;
His active powers their uses all forego,
Norsenses, tongue, nor limbs their functions know;
In melancholy lost, the vital slame
Informs, and just informs the listless frame.

Not attempting an investigation of a case, which, from its very nature was so abstructe and intricate, that it were impossible for any practitioner to draw any conclusion whatever, that might be either certain or satisfactory, I ventured only to point out such a one as might be probable, and in this pitiable and unpromising situation of appearances was defired to render him

every medical affistance in my power; a trial in which I engaged with the greatest diffidence, and the most forlorn hope of fuccess. To awaken and rouze him from his torpid state, and give a brifker motion to the fluids, feemed to be the most obvious indications of cure; phlebotomy, vesicatories, the warm pediluvium, fomentations to the feet and legs, emetics at stated periods, the Oleum Ricini as an aperient, the camphorated julep at bed-time, James's powder, and fuch other medicines as bade fairest to assist the natural fecretions, were ineffectually tried for the space of eighteen months, without producing any fensible alteration in his complaint; the emetics confifted of three grains of tartar emetic and one

scruple of the pulvis Ipecacuanha, and never failed to bring off from the stomach a large quantity of black bile; the steams of warm water, in which rosemary, myrrh and camphor were infused. were two or three times in a day constantly thrown up to the head and face: friction was also used to the extremities. as well as warm and spirituous fomentations, without the least favourable prognostic of success; and, at the end of the above space, the restoration of his health and spirits seemed to be at as great a distance as ever. Tired by follong and fruit. less an attendance, I desired to resign my appointment and to be dismissed. and that a trial might be made of fuch practitioners, whose skill and judgment were fanctioned by longer practice and

observation than my own, which, though easily found, it might have been difficult to have procured one, whose endeavours had been more unremittingly employed to serve his patient; of this, my employers were gratefully fenfible, and it was judged proper that I should continue my advice and attendance for fome time longer, when I contented my; felf with giving him an emetic at the distance of every third or fourth week, and, laying afide every other medicine. was determined to try the vitriolic ether, fixty drops of which were given him in an ounce of camphorated julen and simple peppermint water three times in a day, and it was continued four months before its efficacy was apparent; the urine then first began to

emit a favourable sediment, his aspect was unbent, and became more natural; he could walk out with an assistant without attracting the notice of paffengers by any fingularity in his gait or manner; his nights became calm, easy and refreshing; he could feed himself, and, in a little time, converse in his usual manner. To exercise of body were added the stomachic bitters; the had regular flools recovered his flesh, and in the beginning of February 1782, went to Bath, where, having drank the waters the usual time, he returned in a very good stateof health, and by a letter, with which I have been very lately honoured, I have the fatisfaction to know that he has continued perfectly well both in

160 CASES OF INSANITY, &c.

body and mind, and has ever fince been able to perform the duties of his function with every degree of propriety.

# CAS E XXXI.

ABOUT seven years ago, Miss E.

T. about five-and-twenty years of age, naturally of a tender and delicate constitution, and extreme sensibility of mind, without any apparent cause, suddenly complained of a strangulation of the fauces, from which time she became low-spirited, costive, and subject to statulencies; anxiety, with a slight alienation of mind, succeeded;

her appetite was depraved, she had eructations, distension of the stomach, pain and heart-burn, and was, at times, fubject to a kind of epileptic syncope, in which fenfation was for a few minutes totally suspended; her urine was fometimes suppressed for five or fix days at a time, and was always made with pain; she had a dry frequent cough, which was increased during motion or eating, and more particularly fo in the period of irritation; her eyes were wild and projecting, her face, for the most part, bloated and florid, and her actions were, in general, abfurd and extravagant; she had seldom any febrile heat, but constantly complained of an excruciating pain in the back part of her head, and pain and tension

in the left hypochondrium; the menses were suppressed, and hysterical faintings frequently fuperfeded. In this state, the best medical advice was obtained; but no relief being found, after many repeated trials, she was fent to me, emaciated in body, and, in a state of mind, little short of raving madness. Her respiration was quick and short; the pulse weak, quick and hard; she had frequent rigors, with restlessness. pain in the loins, distortions of the features, and spasm of the muscles along the spine, bending the body backwards: her voice was weak and fcarcely articulate, and her whole fystem such, as to threaten the most fatal confequences; yet, she revived from this dangerous state, and was so much better in

every respect, that, for some weeks together, we actually began to entertain hopes of her entire recovery; but, on a fudden, one morning, foon after getting up, her cough returned, she complained of a straitness in her breast, and a great difficulty of breathing enfued, with ædematous swellings in her face, arms, hands and feet; she passed little or no. urine, and had constantly a nocturnal febrile spasm. But all these complaints, in a few days, appeared entirely removed by the free use of the powder and oxymel of fquills; but, at a time, when, to all appearance, she feemed in every respect much better than she had been for some time past, she died suddenly from fuffocation. This was truly confistent with her own defire, which

fhe had frequently in her lucid intervals expressed; and, with the concurrence of her friends, and with the joint affistance of another practitioner, I proceeded to the operation of opening her head, by fawing through, and lifting up the bones of the cranium as usual, and the appearances were as follow:-The right temporal muscle was very much enlarged; on taking off the upper part of the skull the contents were found fo turgid as immediately to expand, nor could we again compress them into their former dimenfions as before within the limits of the cranium; the feptum nasi appeared elongated and enlarged; the dura mater adhered to the skull in several places, but more particularly on the right fide

to the inferior part of the right parietal bone, over the lambdoidal future on that fide, and over the greater part of the occipital bone on the same side; the veffels which run along this membrane appeared varicous, its fubstance. was thicker than usual, and the finusses were much distended with blood; the pia mater on the right fide was rather of a dark livid colour, and fomewhat enlarged, and the furface of the brain itself bore the same complexion; in the lateral ventricles there was a quantity of a turbid vellow fluid, from which the other ventricles were entirely exempt; the plexus choroides was in its natural state; the pineal gland was rather more enlarged than common, and remarkably foft in

its texture, and, the carotid arteries and internal jugular veins were much larger than ordinary; the feptum lucidum was preternaturally thick, and, on opening the thorax, a large veficle was found adhering to the left ventricle of the heart containing a quantity of an atrabilious fluid; the pericardium adhered to the right ventricle of the heart, and, on being opened, contained a quantity of rusty-coloured water; the fpleen was very large, but appeared of its natural complexion; the liver was of a pale lead colour, and in its convex part covered with hydatides; the omentum was of a livid colour, its veffels turgid and it partially adhering to the anterior parts of the peritonæum; the mesentery was of a dark red colour, and in veffels turgid, and the

gastro epiploic vessels appeared also turgid, and in some parts varicous; the parts to which the cæliac and myfenteric arteries and veins are distributed. were in a state of inflammation; the intestines appeared in a natural state; the flomach was distended with wind. which emitted a difagreeable fmell, and its coats appeared much thickened; the pylorus was fcirrhous and its passage closely shut, and the lungs, pancreas and kidnies were in a natural state. As appearances upon the contents of the skull, in persons who have died maniacal, have hitherto thrown but little light in the way of the curious investigator, perhaps it might be fome improvement to our knowledge of this dreadful malady, were those gentlemen.

168 CASES OF INSANITY, &c.

who have frequent opportunities so to do, not only to describe the appearances of such morbid bodies upon dissection, but carefully and accurately to take out and weigh the cerebrum and cerebellum of patients, whose skulls they have opened, and, from thence, draw such comparative inferences, as might appear interesting and singular.

#### C A S E XXXII.

Communicated in a letter from Mr. B. Spinluff, Surgeon of South Hedingham, in Effex.

SIR,

"I AM requested to write to you the case of a lady in this neighbourhood, whose melancholy turn

of mind has rendered her unfit for fociety, and given the greatest anxiety to her friends and relations. She is about fixty years of age, or rather more, was affected with depression of fpirits forty years fince, which fettled into a fixed melancholy; she was at that time conveyed to some public hospital, I think St. Luke's, where she caught the fmall-pox; the pustules were pretty numerous, but distinct, and her former complaint very happily terminated with the latter and she remained in a tolerable state of health till within the last two years; when, as I am informed, the medical gentlemen declared the fever and complaint in her bowels, with which she was then feized, was of a bilious nature, and she

was treated accordingly. It is to be remarked, that, during her indisposition, she had a slight salivation, and was perfectly free from every diffreffing idea; no fooner did the spitting cease, than she became low-spirited and embarrassed with a continual train of the most anxious thoughts: I am not able to fay how far the falivation was occasioned by mercury, exhibited during the bilious complaint, but am inclined to suppose it was the effect of it. I was defired to visit this unfortunate lady, about a year fince, and found her mind filled with horror, fear and folicitude; her pulse quick and full; she was thirsty, and indulged in an unlimited use of meat, good ale, wine, &c. the urine sometimes pale, fometimes high-coloured,

and never depositing any kind of sediment; her appetite good and memory perfect as ever, had feveral hours fleep in the night, yet apparently more miferable after it. I have taken blood from her arm repeatedly, and given her purgatives and antimonial vomits at due intervals; at the fame time infisting upon a cooling diet and diluting liquors, with which she has complied, though reluctantly, fince my first attending her; I have given calomel in fmall doses, with a view of producing a flight spitting again, but was never able to obtain what I thought fo defirable a purpose; the fauces became a little fore, and her breath offensive, in confequence of the mercury, but not the least spitting, I therefore laid it aside, 172 CASES OF INSANITY, &c.

and had recourse to the former treatment; she remains rather more composed, but still in an unhappy state, and her friends would be happy to do any thing in their power likely to contribute to her recovery, and they beg you will inform them, by letter directed to me, whether you think, at her time of life, there is a probability of cure, or, if you choose to order any medicine, they will be ready to make a proper acknowledgment."

I am, Sir,
Your most humble Servant, &c.

S. Hedingham, Effex, Nov. 19, 1781.

### MY ANSWER.

SIR,

"THE case you mention is a very fingular one indeed, but forty years having elapsed, since her melancholic complaint first took place, is a long space of time; your conjecture, in regard to the mercury, is very probable and founded upon much rationality. As the calomel does not take place by internal doses, and its effects, thus administered in the present state of the case, may not be the most friendly to the prima via, suppose we were to rub a few grains within-fide the cheek every night and morning, according to Clare's method: a falivation

is easily to be raised by this means, for which I must refer you to his book. It is very probable that a fresh discharge from the falival glands may be attended with relief, and, if you approve of it, would advise a trial; should it not succeed, a seton, I presume, might be the next thing to be thought of; her liberal manner of living must be a great impediment to the cure. therefore, a flender and cooling regimen should be complied with, and the body kept open with the foluble tartar. What was the general complexion of the blood? I think there is a great probability of our doing the patient some service, and, with your approbation, we will direct our joint endeavours to that end, for I have no

medicine that you have not, and noftrums I despise, therefore, as no good has accrued from either venæfection. purgatives, or antimonial vomits, let us lay them entirely aside, raise a ptyalism with the calomel as a topic, keep the body laxative with either the foluble tartar or Oleum Ricini, as either best suits that purpose, in such doses as may appear to you most proper; at bed-time let the patient use the warm pediluvium, and immediately afterwards take a draught of the Julepum Camphora, which may be repeated as often as you please, so as not to interfere with the aperient medicines. At any time, when the anxiety is most intense, reclining the head over the steams of hot water, not only amuses,

but has been found to have a very good effect; frictions with a coarse towel, or a flesh brush, are in such cases very often serviceable. These matters I fubmit to your confideration, and, should they meet with your concurrence, may be reduced to immediate practice; if thought necessary, I can make it convenient to visit the patient, as speaking often conveys more than writing; but this I shall leave to the decision of yourself and, the friends of the afflicted lady, and in the mean time,

Remain,

Your's respectfully, &c."

#### THE REPLY.

DEAR SIR,

"THE uncertainty of our profession is ever an apology for us in the line of our correspondence, and you need not be reminded, that, in this respect, we are in general the least to be depended on, yourfelf only an exception to this remark. I beg your pardon for not fooner answering your obliging and very polite letter, but, now beg to inform you, that our patient has conformed, beyond expectation, to your advice; and, I think, has received confiderable benefit. A gentle spitting took place by means of absorbtion, according to Clare's direction, in

a very agreeable manner, and continues as I could wish; she seems much composed by immersing her feet in warm water; takes a draught of Fulepum e Camphora, as you defired, every night, which agrees well. I am this morning writing to the gentleman who heirs the estate, recommending in the strongest terms that you might pay her a visit upon the subsiding of the salivation, and, as he is a fensible good man, and would do any thing for her advantage, as foon as I am favoured with his answer, shall give myself the pleasure of writing again to you, and find a fingular pleasure in subscribing myfelf

Your most obedient

S. Hedingham, humble fervant,

Jan. 9, 1782.

B. Spinluff."

#### C A S E XXXIII.

IN March 1779, my advice and affiftance was requested by letter, in the case of J. O. who had been several times in a very unhappy way indeed; his fpirits were unaccountably high in fummer, and as much depressed in winter, owing to a free way of life, and frequent excesses, to which he had been too much addicted from his early youth; he was now turned of threeand-forty, and his diforder, which it was hoped would have gradually decreased, appeared in the summer before with double violence, in confequence of the hurrying life he was engaged in. previous to and at the time of the encampment; he was very indifferent the fpring before, and was attended a few times by a physician in London, who thought his cafe highly nervous, as others of the faculty had done; and fome had conjectured that the use of mercurials had been of differvice to him in early life; various causes had been affigned for his disorder, and as it was not hereditary, none of his family having been troubled with any thing of the kind, his relations imagined it must have been brought on by his manner of life, and hoped that it might be removed, or at least relieved. Notwithstanding his cruel disorder, he was much beloved by his acquaintance and, to strangers, he generally appeared perfectly well; his appetite was small

and weak, he was either rigidly costive or extremely lax in his belly, dejected. drowfy, with loss of memory, and fubject to acid eructations; he often complained that his eyes faw objects indistinctly, was forgetful, at times ridiculously timid and fearful, and, complained of a head-ach, like that which arises from a crouded playhouse; had pains fometimes in the right, and, at others, in the left hypochondrium, but without any perceivable tension in either; his digestion was very bad, he fuffered a general debility of the whole frame, had distressing ideas, was senfible that the functions of his mind were much impaired and that he laboured under a flight phrenzy, which he was fearful would end in a con-

firmed mania; his pulse was flow, weak and often irregular; he would frequently fetch deep fighs, and fancy his life in imminent danger; he passed restless nights, and seldom complained of thirst; his urine, was, in general, almost colourless, forming no cloud and depositing no fediment; the disordered state of his mind, as well as his body, appeared to arife from the same cause, therefore late hours, morning drinking, and unbounded diffipation were abfolutely necessary to be entirely laid aside; moderation of diet and temperate regulations of every kind, feemed to promife him the greatest relief; to relieve and affift the alimentary canal, a gentle emetic was given; his costiveness was relieved by an occasional exhibition of the Oleum Ricini; his nights were rendered eafy by the influence of an opiate; he made use of the cold bath; and the bracing, strengthening medicines, most conducive to the cure of a relaxed state of the folids, were administered with success; and, by temperance in food, drink and fleep, he recovered his mental vigour and bodily health and strength, in a space of time, not exceeding four months; and, by continuing in this course with manly refolution and perseverance, he foon acquired fuch an habitual line of felf-regulation, as fecured to him that health of body and foundness of mind, which every rational man would think it both his duty and interest to attain.

## C A S E XXXIV.

A LADY, about thirty years of age, of a gloomy, morofe temper, was put under my care in the year 1781. About feven years before, she first made an attempt to destroy herself; after which, she continued well for three years, and then, some little disturbance happening in the family, which no way concerned her, but in which she chose to take a part, she became ill again and made the like attempt; upon which, her father put her to board in a family where she was an utter stranger, and unconnected with any one; she continued well in this place for two years, but, about two months before she came

to me, had a nervous fever, became deranged inher manner, had a wild appearance in her looks, and was so agitated in the night as frequently to get out of bed; by proper affiftance she got the better of this, but foon relapfed into the fame way again, and again made an attempt upon her life. She was a person, whom, in her best reason, was little susceptible of gentle, tender or delicate affections, and very narrow in the range of her own ideas; when I first saw her. the had the most forbidding aspect I ever beheld, and the picture of her body was an exact emblem of the state of her mind; a fullen taciturnity posfessed her, and she scarcely knew or attended to any external objects; her skin was pale, sallow, squalid and dry;

her pulse was hard and full, and her feet and ancles much fwelled and puffed of an evening. To give a brisker motion to the fluids, electricity was used, a vein was opened, and the warm pediluvium used every night at bed-time; the Julepum e Camphora was given every night at bed-time, and, in the course of the night, generally repeated; the body was kept moderately lax with an aperient electuary, and the menstrual discharge, which had been fuppressed for some months, was promoted by the use of proper emmenagogues; at the end of three months she menstruated freely, but rather painfully to which she had been always fubject; she now began to speak and ask for her food and medicines, and,

after a continuation of the above methods about five weeks longer, she recovered the functions of her mind to the same degree as before her illness, became well enough to return to her friends, and has not fince relapfed.

# C A S E XXXV.

M. M. a very fensible woman, suffered much anxiety on account of the cessation of her menses, a period, which, from her time of life, she had every reason to expect; the practitioner to whom she applied, though in other respects able and judicious, rather supported, than repressed the distressing

notions she entertained on this head; a regimen was proposed to her, and a medical plan laid down; but having unfortunately imbibed the most dreadful ideas from fuch a change in her constitution, and being prepossessed with the belief of its proving fatal to her, it operated too powerfully on a too fusceptible mind; in consequence of which, fhe was continually terrifying herfelf with apprehensions of the worst nature, and, by a continued course of anxiety. gradually impaired her mental powers; as yet, however, she had suffered but little interruption in her health, but, on a fudden, was attacked with the most genuine figns of a plethora, spasmodic affections of various parts, fwelled ancles, dry cough, extravagant dreams,

inflammation in the eyes, heat, flushings and head-ach, with stupor. In this state of the case, an eminent practitioner in town was applied to, and, as she had been accustomed to copious evacuations, she was ordered to be frequently bled in small quantities; the diet was moderated, and the bowels kept in a laxative state, by means of aperients; in this manner she proceeded for fome months, always about the time of menstruation being subject to profuse sweats and violent heats, during which time, her reason always appeared much clearer; but afterwards. her wild and frantic manner recurred. till, as the above period came round again, the same symptoms recurred with the same effects. As the vehemence of the fymptoms required it, at first she continued to lose four or five ounces of blood every month, but as her strength apparently decreased with the frequency of this operation, the occasion also seemed to decrease; and, as her mind still continued in a state of perturbation, it was put off to much longer periods: she continued to take gentle laxatives, was carefully watched, and, except some nervous affections, which were always observed to be more violent at the time of menstruation, in point of health, she remained tolerably well for fome weeks; when, on a fudden, she was attacked with an immoderate flux of the menses, when Rest, Anodynes, and proper astringents, fuccessfully took place; but she was

extremely enfeebled by the violence of the hæmorrhage, and had hardly recovered a moderate degree of strength, at the end of fix weeks from the first attack. when it recurred again. The relapfe was attended to with the same means of cure as the former, which were equally effective; and, when it ceased, such medicines as allay irritation, and produce rest. together with a light nutritive diet, were prescribed to prevent its return, and she continued pretty well till the middle of the autumn following, a period of eleven weeks, when she was seized with an intermittent, and a return of the uterine flux; and, as both these complaints obviously arose from debility and relaxation, the bark was judiciously given, and had the defired effect. After this

recovery the patient became every day stronger in body, and more consistent of mind; and, at her own request, and with their approbation, returned to her relations in the country, where, through the officious care of a female dabbler in physic, who was often confulted in the management of her fex at the cellation of their menses, she was induced to take some strong aloetic medicines, by the heating qualities of which the piles, strangury, and racking pains in the loins, difficult refpiration, imbecility and derangement of the mind, pain in the bowels and uterine hæmorrhage occurred. this emergency I was defired to prescribe for her, and, upon enquiry. became acquainted with all the parti-

culars which I have recited above. The patient did not feem much debilitated by the present discharge, and, as the state of the pulse allowed of it, I ordered four ounces of blood to be taken from the arm, which, when cold, was covered with a thin gluten; the pulse appeared low and much funk by the operation; an emollient clyster was administered, and, by a course of antiphlogistic medicines, anodynes, rest. and a sparing diet, the patient was thoroughly recovered in three weeks from this dangerous relapfe, into which she had been precipitated by the extreme ignorance of her lady-doctor. Upon enquiry, I found that the patient, in early life, had been subject to small ulcers on the head, difcharging a

humour which dried into a white friable crust; also, to pain in the eyes and foreness and tumefaction of the eyelids, which gradually disappeared soon after the first commencement and regular return of her menses; and, as she had often complained of fugitive pains in her breafts, and other glandular parts, I advised an issue in her arm, which, after fome degree of opposition on the side of the patient, was agreed to. I recommended the most strict attention to diet and exercise, and befought her most religiously to abstain from such pertinacious, precarious and dangerous advice, the bad effects of which she had fo painfully experienced. The alienation of her mind, which had been perceived upon this last attack, receded

with the fymptoms which had occafioned it, and her rational faculties returned with her health; for a year and a half she went on very well, and feemed disposed to corpulency, but, by staying too long at an assembly, she was feized with an inflammation of the tonfils, attended with an eryfipelatous eruption upon the left fide of her neck and face, a spasmodic affection of the bowels, a nausea and sickness at the stomach, a flux from the uterine vessels, with much hurry and confusion of thought and many frantic actions; fhe was bled to fix ounces, the fymptoms were entirely suppressed in about ten days by the same means as before, and the patient has continued in good health, for more than three years past, and entirely free from mania.

## C A S E XXXVI.

THE late happy and providential escape of his majesty from the horrid attempt of assassination, from the hand of an infatuated maniac, appears in itself sufficient to determine all those persons under whose care and protection such unfortunate persons are, not to let them venture at large; many of those disordered people, may, for years, appear persectly innocent and harmless, but, from a strict and intimate acquain-

tance with fuch unhappy beings for a feries of years, I am fully perfuaded to think there is no fecurity or dependence at any time, in any place, or under any circumstance whatever, to be placed in them; and, as no one can fay how fuddenly the diforder may increase or return, it behoves every one who has any care over them, to be upon their guard; nor should the friends and relations of such patients be too hafty in forming a judgment of their recovery, as to the fafety of their return to their accustomed manner of life; for, after a recovery from a state of infanity, the mind is, for some time, as weak as the body after any of its violent disorders; and, as in the one case, patients cannot immediately return to the exercise and diet usual in the time of health, without the utmost danger of a relapfe, so can they not, in the other, return to their former objects, and to the business and hurry of life, without running the greatest risk of having their minds overset. A relapse in this disorder is as much to be apprehended and guarded against, as in any other whatever; and it should be remembered, that fuch convalescents, either from temporary feelings of diftress, sudden prejudices, from an extravagance of superstitious notions, or the momentary impulse of a disordered imagination, are much to be feared, and should be re-admitted into society with a particular degree of caution and circumfpection, which may be gathered in general from the many

instances that have occurred to exemplify and strengthen this remark, in authors, who have professedly written on the subject of infanity. From my own observations in particular, I shall here only select one, the melancholy effects of which are still deeply felt by the furvivors of the worthy and respectable family to which the unfortunate lunatic belonged:-he held a commission in the army in the year 1748, and retained it upon half pay till the time of his death, which happened in the year 1782; he was the eldest son of an ancient family in Cambridgeshire; naturally of an imperious and arrogant disposition, whimsical and fuspicious, but no very extraordinary fingularities became observable in his

manner and behaviour till about the year 1776, when he fuddenly became troubled with an hypochondriacal diforder, and foon after fell into a deep melancholy, but, at that time, did not attempt any violence to himself or others; by proper care, and with the affistance of medicine, after a few months he recovered from this diforder, and, for some weeks, appeared in every respect as well as usual; when, on a sudden, he became possessed of the most whimsical and absurd fancies, fuspicions and aversions; he was timid, irrefolute, and weak in his judgment; but this was the less observable, as he was a man never remarkable for the most lively feelings or the brilliancy of his imagination; at length, by his

disorder, being impelled to speak and act in a most ridiculous manner, he was fent to a house, destined for the reception of infane persons, in the vicinity of the metropolis; in this situation he had not continued many months. before his mother and another near relation, impelled by defire of feeing him, paid him a vifit; he appeared exceedingly glad to fee them, and making use of the most specious and plausible pretences, with all that craft and cunning, in general fo closely allied with lunacy, to induce them to a belief of his perfect fanity, and at the same time. appearing very cool, confistent and rational, they, without farther deliberation, concluded upon giving him his enlargement, and the next day abso-

lutely fent for him home, where, for nearly a week, he appeared in every respect, both in words and actions, the fame as before his illness; but one morning, getting up earlier than usual, and coming home wet and dirty after a frantic excursion of some hours, he walked into the parlour, where his mother was fitting by herfelf, and she inadvertently remonstrating with him on his behaviour, and interrogating him as to the reason which could induce him fo to do—most horrid to relate! the maniac, without the least ceremony and before she could possibly call for or receive the least assistance, catched up a poker which was standing in the fire-place, and dashed her brains out about the floor: he did not offer to

escape, or to commit any farther violence, nor appeared then or ever afterwards to feel the least pain or regret for this shocking action, soon after which he was delivered for life into my care, and died at my house about three years afterwards of a hydrops pectoris, in the 51st year of his age.

# C A S E XXXVII.

THE subsequent case, as well as another, almost of a similar nature, which I shall not at present recite, I owe to the obliging communication of a correspondent on whose authority I can rely. In the beginning of the month

of February, 1777, a poor man was bitten in the calf of his leg by a dog that was mad, he was immediately bled, blistered upon the part, dipped in the falt water, and took a nostrum of some celebrity in the parts where he lived; after which he underwent a course of metalline antispasmodics. The part that had been wounded, was entirely dried and a cicatrix formed, in which, however, on the eighth of March following, being just a month from the time the accident happened, he began to complain of pricking shooting pains, attended with heat, and became penfive, tremulous, watchful and drowfy; these fymptoms were looked upon by the furgeon who attended him, as the indications of an incipient hydrophobia; he complained of a tingling in his ears, lofs of hearing, was weary, inactive and torpid, had no fleep, and every attempt to fwallow liquids excited painful convulsion, together with the greatest horror and aversion at the fight of them; he was still capable of making rational answers, and frequently recovered from the convultive paroxyfms, which were renewed upon every fresh attempt to swallow liquids; and, although he was parched and burnt, with an excessive defire to drink, yet, no fooner had any fluid touched the tip of his tongue, but he was instantly seized with the most terrible stricture of the jaws, followed by universal convulsions of the whole body. by which he was totally deprived of

fense for two days together; there was a most remarkable dilatation of the pupils, he could not fee, he had frequent reachings to vomit, but feldom vomited any thing up, yet had often regurgitations of the stomach; his eyes had been fierce, and his aspect threatening, but on the third day, from the first attack, they became more fixed: a coldness of the extremities supervened, with an irregular and intermitting pulse; the convulsions returned at shorter intervals, a constant delirium. with extreme anxiety, took place; there appeared not in the patient, at any time, the least desire to bite, and, on the evening of the fourth day, the unhappy fufferer refigned his breath without a struggle. Dry cupping, mercury,

fcarification, the warm bath, and fea bathing, as well as in two other cases of which I had some knowledge, proved fallible, and the unfortunate persons both died hydrophobic; the one about five weeks after the injury received, and the other in less time. It is therefore highly necessary to recommend to every person, who is fo unfortunate as to be bitten by a mad dog, or any other rabid animal, as the only fure means to obviate the fatal confequences which may arise therefrom, the timely total excision of the wounded parts, as this has been incontestibly proved to be the only fure prophylactic. No dependence whatever ought to be fixed on any one of the numerous nostrums, which are fallaciously called specifics and preventatives, for

not one of them all, but, upon a careful and judicious analyzation, have, in their compound parts, been found trifling to a degree, and totally inadequate to oppose the evil for which they are intended. The warm bath, fea bathing, dry cupping, musk, mercury, metalline antispasmodics, nostrums of all kinds, and even caustics themselves, have too often proved fallible for any certain dependence to be fixed on either of them. And, therefore, the excision of the parts bitten, by a mad dog, appears to be the only fafe and efficacious prophylactic; for, as the authors of the Monthly Review, in their notes to correspondents, very justly observe, "to flatter people with security from other more gentle methods, would be to deceive them in a matter of the utmost consequence, and might in the end prove no less prejudicial to them, than unworthy of us."

# C A S E XXXVIII.

and the board of the state of the same

a la destination et al contraction of the traction

AFTER long and very severe fits of the intermitting fever, not regularly carried off, a tradefman near Jewrystreet, Westminster, aged thirty-four, applied to me on the 22d of October, 1780; about fix weeks before, as he informed me, he had an abfcess formed in his leg; which had suppurated, and, after a copious discharge of near three weeks, had fuddenly dried up. fince which time he had been subject

to great anxiety, with a fense of weight and coldness in both his legs; his appetite was depraved, he had a tension in the belly, with constant slight pains; his breath had been extremely offensive; his spirits were depressed; his hearing not fo good as before; he also complained of a head-ach, in a fingle small spot over the left orbit, as if a nail was driven into the head, of finging in the ears, debility, thirst, and a frequent dimness of fight; his pulse was weak and irregular; the pupils of his eyes was much dilated, but more particularly fo the left, and his aspect unfettled and wild; he was costive, and informed me that his urine was almost colourless, forming no cloud and depositing no sediment; that he was

naturally timid, irrefolute, prone to fudden and excessive passions of the mind, and had, for some time past, paid too ferious an attention to the noify and dangerous harangues of a methodist preacher in the neighbourhood where he lived, through which he had frequently concluded in his own mind that he had lost all chance for falvation, and the fayour of his Maker; which had fuch an effect upon him as frequently to throw him into tremblings and spasms. As his habit appeared much debilitated and weakened, I advised him to a more nourishing diet, to encourage more comfortable ideas, and entirely relinquish the false doctrines of the enthusiastic preacher; also to have an issue immediately opened in the leg where the

abscess had formed, and was dried up; and, to brace and strengthen him, Irecommended a course of the pyrmont waters; after which I heard no more of him till I received an order to take him into my house as a lunatic, the 13th of December following. When committed to my care, he laboured under the most dreadful depression and bashfulness, complained of the most uncomfortable bodily feelings and mental perplexities, and every trifling occurrence seemed an object of inquietude, anxiety and vexation; he was costive, still complained of the same pain in his head as when he first faw me, with stupor, tumesaction of the eye-lid, and inflammation of the eyes. The warm pediluvium, and a feton

between his shoulders, in the direction of the spine, was ordered, the camphorated julep administered thrice in twenty-four hours, and his body was kept properly relaxed with the Oleum Ricini; which practice, (with the difference only of a fumigation of rosemary and camphor to his head and face every night and morning) was fanctified by the concurrent opinion of an eminent physician, who was confulted in the case at the particular instance of his friends, in conjunction with myself; and, at the end of eight weeks, the patient was fo thoroughly recovered in his intellects, as to become confiltently conversant and fociable; and, as his complaints were now entirely of the nervous kind, he was

advised to visit Bath, and, by the efficacy of its waters, in a few weeks, he was fo entirely invigorated and recovered as to be able to return to his business, in which he has continued ever fince uninterrupted by any diforder either of mind or body. As this patient's infanity, as well as that which I shall next mention, happened after a fever, I shall here quote the opinion of the celebrated Hoffman. who mentions infanity, of every species, as frequently occurring after most forts of acute fevers, and especially if they have been protracted to a great length; and accounts for this circumstance, from the diffipation of the animal spirits, by the violent and long-continued febrile heat and watching; from a defect in

# C A S E XXXIX.

M. O. was of a thin hectic constitution, and had laboured under a troublesome pulmonary cough for some years; when I first saw her the pulse was remarkably quick and sharp, her eyes were in continual motion, and her sace of a slorid hue. She had enjoyed the advantage of a polite education, and had always been remarkably brisk and lively till soon after her recovery from a long protracted acute fever; she then became torpid and lost in an unthinking joyless inactivity, from which, if at any time she recovered, or was rouzed, every degree of delirium, of fear and terror, supervened, until fhe reverted into her wonted torpidity; and, in one of these intervals of horror, she had once attempted to put an end to her own life, but was happily prevented; gentle opiates, with balfamic medicines. had been given her to palliate the cough, which was flight, short and frequent, without expectoration; the warm pediluvium, or fomentations to the feet and legs, were used every evening at bed-time; a perpetual blifter was also opened between her shoulders, and the camphorated julep administered thrice in a day;

but these means proving ineffectual, an expression of the millepedes, the balfamic pills, and an infusion of the madder root were next tried. Air. exercife, and the Briftol waters had also their respective shares in our attempts to cure, but all to no kind of purpose, for the poor young lady grew worfe and worse, and, in three months time, without ever recovering one ray of intellectual reason, died insane and tabid.

# CASE XL.

ABOUT five years ago, M. S. about eighteen years of age, of a fanguine complexion, and till then very healthy, fuddenly complained of a strangulation of the fauces, pain and hardness in the neck and spasm of the maxilla. with frequent fainting and exceffive menstruation; a practitioner, of some eminence, was called in, through whose affistance, in a few days, she recovered; but her mind, from that period, became very much disturbed and confused, there was an unusual fierceness in her eyes, and her prevailing fymptom was anger, which often exhibited itself in such violent and groundless

rage, that it was become absolutely necessary to confine her; she was naturally of a meek and amiable dispofition, and not in the least prone to be irritable: but she was now much altered, became peevish, contentious, and disposed to mischief of the most violent desperate nature, and replied in an angry tone to every one who spoke to her; she slept but very little, and was not perceived to perspire at all; fometimes she raved aloud. and at others, spit at, and endeavoured to bite those about her: she foamed at the mouth with anger, and whiftled, fung, shouted and swore, alternately. In this state I found her on the 12th of March 1781, the tunica albuginea of the eyes was streaked with red, the

countenance was florid, her head was hot, her pulse quick and full, her tongue was white and furred, there was a fordes upon the teeth and lips, the eye-lids were puffed and tumefied, a kind of an inspissated lymph abounded about the mouth, throat and trachea, which was much increased by the vehemence of her actions and gestures; her skin was dry and harsh; her features had rather a greafy cast; she had no appetite, did not feem eager to drink; her breath was extremely hot and offensive; she had frequent eructations; her respiration was difficult by paroxysms; she had rigors, with reftleffness and watching; she had but one stool for the last three days, which was remarkably high-coloured,

billious and offensive; she often ground her teeth, passed her urine involuntarily, groaned, yawned and fighed. Upon opening a vein in the arm, scarcely four ounces had been taken away before the pulse flagged and funk from eighty strokes in a minute to fixty. and, a syncope coming on, the orifice was closed; when cold, the blood was covered with a thin cake of gluten: the evening, following the operation, the tartar emetic was prescribed in fuch dofes as gently to puke the patient, and it was repeated at the diftance of twelve hours, but as no flool was procured by this means, the belly was opened by an emollient laxative clyster; a seton was made between the shoulders in the direction of the spine,

and an emulsion, with foluble tartar, was given occasionally, to keep the body fufficiently lax; the camphorated julep was given in proper doses every fix hours; in the intermediate spaces, to abate the increased oscillatory contractions of the vessels. fomentations of poppy heads and chamomile flowers were applied to the feet and legs, and, the fymptoms gradually abating, the patient, after fourteen days, became confiftently peaceful and rational, and, in less than a month, was capable of expressing herself with propriety in a letter to a female acquaintance, to whose house, after recruiting her strength with a course of aromatic bitters and Bath waters, she made a visit; and, remaining in a good

state of health, she soon afterwards entered into the matrimonial estate, much to her advantage.

#### C A S E XLI.

THE Rev. Mr. R. of relaxed fibres and of a scorbutic temperament from his infancy, but naturally of a cheerful cast of temper and an open and generous mind, till he fustained the pressure of a particular affliction, which occurred to a near relation, when he became subject to the most anxious and distressful affections, by which means his body was gradually weakened, and his reason impaired; had afterwards the most harraffing and difmal train of ideas continually before him, and he was almost ever under the influence of lamentation, grief and despair. In this state he had continued for some months. in which time antimonials and strong purges, fagapenum, hellebore and valerian had all been repeatedly given him; but still his imagination was deranged, and his judgment vitiated. In April 1782, I was confulted on his account; depreffion and melancholy were deeply impressed on his features, and the dreadful anguish of dejection and internal uneafiness had overwhelmed his mind; his face was pale and fallow, his hands were swelled and red; he often hiccupped, and spoke with a peculiar hollow voice; his pulse was hard and chordlike, with frequent palpitations

of the heart; his respiration was deep and flow; he was wakeful in the extreme, and his skin felt squalid and dry; he had not perspired in the least. and, when he spoke, there was a particular tremor of his tongue; he had no fever, and there was a visible wasting of his flesh; and this specific state of his body was apparently caused by the exceedingly distressed situation of his mind, the agonizing influence of which gave me very little reason to hope, or even imagine, that the usual means of cure would prove efficient; and, in this respect, I was very forry to find myself not disappointed, for, after he had been under my care a considerable length of time, and the warm pediluvium, emetics, cephalic steams, the

camphor, a feton, the æther and various cephalics and antispasmodics had been repeatedly and respectively tried, every expectation of relief vanished, and the unfortunate patient has ever since continued in the most pitiable state, consigned to proper management alone.

### C A S E XLII.

IN remote causes of infanity it is usual to attribute the complaint either to some affection of the brain, its vessels and membranes, such as distension, enlargement, inflammation, induration, &c. or to some mental cause, as intense

application of mind, study, business, or schemes of any kind that require great and unremitted attention, or much exertion of genius; or to fudden, violent or habitual passions of various kinds, and here our disquisitions generally terminate. Whereas, I must ever be of opinion, that, were we oftener to extend our enquiries, by tracing them back in a lineal direction to the progenitors of the maniacal patients, we should generally adopt the maxim, that the much greater number of mankind, who become infane upon any particular change in the constitution, have an hereditary pre-disposition to madness: nor is this mere hypothesis; for the affertion is founded upon observation and experience. For, out

of the great number of maniacal patients which have fallen under my care, in the course of near twenty years practice. I have been able to trace an hereditary pretension to this disorder, in by much the greatest part thereof; and have preferved an exact genealogical register, to demonstrate the force of my enquiries. A gentleman, of some commercial consequence in the city, after much close and intense thinking, was fuddenly feized with a pain in the calf of his leg, with pain and palpitation above the navel; he, at the same time, complained of a pain in his ear, and had fome flight degree of febrile heat; these symptoms were at first attributed to the effects of a stoppage of the cutaneous excretion by cold, and,

as the means of relief, bleeding was prescribed, and afterwards, the reguline preparations at proper distances, and the faline draught in the intermediate times were exhibited; but it foon afterwards appeared that the functions of his mind had been injured by too intense an application to business, and he now exhibited a disposition of mind entirely repugnant to his natural feelings; he railed at, and quarrelled with all who approached him, spoke with furliness and ill-nature. fuspected every one of finister views and nefarious intentions, even those, in whom, but a few days before, he had reposed an implicit considence in matters of the first moment not excepted, and wore in his countenance the strongest

traits of fuspicion and rancour; he feemed anxious to avoid all converfation to fly from the fociety of mankind, and the very appearance of the human species filled him with scorn and difgust; if he was spoken to, he would frown and look contumelioufly, turn away with filent fcorn, or mutter malice and dislike; and, to use the words of Shakespeare, "his wits seemed lost and drowned in his calamities." In this highly infane and mifanthropic state, he was entrusted to the care of a physician, as much distinguished for his honour and integrity as for his skill and experience in his profession; management was allowed to be of the first moment in this case, to which was added fuch medical treatment as was

thought proper; but after every thing of this kind had been tried for upwards of three months, the latter was laid aside, and the former entirely fubmitted to. At this period the patient was entrusted to my care, the character of his case, as above recited. was a just representation of it as to his manner and behaviour at the time I faw him; his appetite was natural, but he would not eat a morfel of any thing. unless it was left in his room by him; his features were contracted, his eyelids puffed up, the pupils distended, and his eyes very strongly indicated the state of his mind; he was costive, his pulse was weak, undulating and foft; his skin pale, harsh and fallow, and he passed his nights in a wakeful

state; after trying a feton, the warm pediluvium, cephalic steams and camphor, and repeated emetics, to no apparent purpose, and every medical effort had been relinquished for upwards of three months, the patient at once recovered his fenses and his reafon, and, continuing fo for four months together, at the end of that time was permitted to return home, when he had fcarcely renewed his applications to business, before he reverted into his former state of infanity, and continued fo for nearly the same space of time as before; and then, as fuddenly and spontaneously, as it were, recovered, the lucid and infane intervals following each other alternately, and nearly in a periodical manner to the present time. Upon enquiry, I discovered that the grandfather of this unfortunate man was afflicted with a similar species of infanity for three years before his death.

#### C A S E XLIII.

J. C. of Buxted, in Sussex, aged about thirty-six, of a sanguine habit and scorbutic temperament, had been afflicted with lunacy for many months; he had taken several vomits, been blistered, and used many methods without success. January 9, 1783, he was sent to my house, in a condition, little short of raving madness; his

appetite was voracious; his breath offensive; he was costive, had a particular difficulty in deglutition, his eyes were bright, fierce and wild, the lids tumefied, and the pupils much diftended; he often put his hand to his head and complained of pain in his forehead; his pulse was strong, and his countenance red and bloated; he had little or no heat, the right hypochondrium was swelled and tense, and his breathing was rather difficult; he had been subject to the hæmorrhoids, before he was attacked with mania, but they had entirely disappeared for several months; he had flept but little, and the skin was dry and harsh; his urine was generally high-coloured and depofited a copious branny red fediment;

he often exhibited fudden transitions of mind and rapid flights of imagination; was noify, impetuous and turbulent, furious, mischievous and audacious. would laugh, fing or talk vociferoufly, with quick transitions from one subject to another, as different images and fancies struck him. He was bled on the third day after coming to me; the blood, when cold, indicated fome degree of inflammation, fixteen ounces had been taken away, but, as he appeared not in the least weakened by its loss and continued as furious as ever. on the fourth morning after the operation, it was repeated in a fufficient quantity to induce a deliquium, which, in this, and every other case where phlebotomy is prescribed, usque ad

deliquium animi is best, and most speedily effected by keeping the patient in an erect posture during the hæmorrhage; the fame evening he had an antimonial vomit, for his costiveness. the Oleum Ricini was occasionally administered, and the warm pediluvium was used every evening; the camphorated julep with nitre was given him every five or fix hours; and in this course, with a due regard to his regimen, he continued for feveral weeks, but without any apparent benefit; the difficulty of breathing feemed rather to increase, but was always relieved for a few days by an emetic; and now the fquill pills were advised, also a feton in the neck, in the direction of the spine, and half an ounce of soluble

tartar in weak broth every third morning, which feldom failed of procuring him two or three motions; the feton drew off a most prodigious quantity of matter; in less than a month, his anxieties, ravings, flights and vociferations, were moderated, but he was still very incoherent; but, between whiles. was more intelligent than he had been at all fince the beginning of his diforder, and, at those times, would attend to what was faid to him, and make pertinent replies. On a fudden the piles appeared again, and bled to a most profuse degree, and, at the same time, his fanity returned in its full force; gentle cooling purgatives were now administered to keep the belly open. which, together with the use of repel-

lent liniments and fomentations, foon relieved him in respect to the piles. after which he underwent a course of mercurial alteratives, and the beginning of July returned to his family, fo well established in body and mind that he has not fince had the least relapse.

## C A S E XLIV.

MR. F. an eminent attorney in London, confulted me concerning his wife, December 2, 1781, she had borne several children, was in her forty-fifth year, naturally of a fusceptible, lively and amiable disposition, but had long been

subject to a desponding species of infanity, for which she had taken the advice of a physician, but to no effect. Her anguish of mind was tormenting to an extreme degree, and her feelings exquifitely fevere; fhe was fo much fubject to flatulencies of the stomach and viscera, as to occasion a tumour in the abdomen, of a globular form, as large as a child's head, with great pain and tension, which made her cry out as if fhe had been in labour; this, in her depraved state of mind, she would often positively aver to be the case, and to require immediate affishance to receive and fave the child; this fymptom never failed of palliation from a warm flomach purge, of a carminative quality, and proper topical applications.

It was observable, that, when she suffered most pain from this preternatural distension of the abdomen, her intellects were much more clear, and she would speak and act with more confistency than at any other time of her disorder, and, upon the remission of this complaint, she never failed to declare that she had been delivered of a child, about which, however, she never expressed any very tender feelings, or made any anxious maternal enquiries. An entire ceffation of the menses had taken place about fix months prior to her becoming my patient; her pulse was, in general, hard and quick; her eyes were dull and opaque, and her voice flow and mournful; I ordered fix ounces of blood to be taken from

her arm, and an aperient electuary, to be taken occasionally, to keep her bowels in a regular lax state; her nights were apparently rendered calm and eafy, by the camphorated julep; a blister was rendered perpetual between her shoulders, and the warm pediluvium was made use of every night at bed-time; the vitriolic æther was given her, in small quantities, in draughts of fimple pepper-mint water, every forenoon at eleven o'clock, and afternoon at five. By this kind of treatment, at the end of three months, fhe was judged well enough to be taken home, where she soon afterwards experienced a relapse, and, after a variety of subsequent changes, died

242 CASES OF INSANITY, &c.

of a Cholera Morbus, in about twelve months after her removal.

# C A S E XLV.

AMONGST all the active sub-stances taken into the stomach, which immediately affect the circulation and have a tendency to work a change in the constitution, perhaps mercury demands our first consideration; and, amongst all the remote causes imputed to infanity, the improper use and abuse of this powerfully singular mineral, may, with great propriety, be considered as a principal, which will evidently appear from the subsequent

cases in point. Carried away by the impulse of the passions, at a time of life when rational conduct and found judgment feldom predominate, a young gentleman, of a thin habit and slender constitution, found it necessary to apply to a furgeon of his acquaintance in town who treated him in a manner fuitable to recent disorders of that kind for which he applied; after fix weeks, from an irregularity in drinking, and a life of diffipation, some fymptoms of his complaint still remained, and he was fuddenly attacked with an ulceration of both tonfils, and there was not the least doubt of the blood's being tainted with the venereal cacoethes, so as to render it necessary to

have recourse to mercurial alteratives. with a decoction of the woods; but, although contrary to his usual custom, he continued very regularly in this course for ten weeks, he found himfelf in no respect better, and therefore was advifed to stronger mercurial preparations, by the fame gentleman to whom he had first applied, till, his complaint being apparently relieved, he was induced to discontinue the medicines, and, contrary to the advice of his furgeon, go into the cold bath, which he had only used twice, before he complained of a pain in the head and cheft, with great anxiety, and a fensation of heat under the sternum: this was fucceeded by vomiting, an obstinate constipation, and a remitting

fever, whose exacerbations returned once in twelve hours, from all which fymptoms, by means of the most judicious medical treatment, in less than a fortnight he was entirely recovered, but now complained, of some internal pustules on the internal surface of the mouth, and became partially infane; a folution of the fublimate was prefcribed twice a day, with a proper gargle for his mouth; he was ordered a light nourishing diet, with the use of the warm bath; but, although after fome confiderable time, there was every reason to suppose that the primary disorder was removed, and he had never had any relapfe to shew to the contrary, yet, notwithstanding every care and precaution that could be used by his friends, who foresaw the impending evil, he grew quite melancholy, stupid and inactive; continued under a total privation of the mental faculties and dwindled into a downright state of idiotism, in which pitiable state he has continued for more than eight years, and from which there is not the least probability that he will ever emerge.

### C A S E XLVI.

A. C. a man of a robust habit of body, used to an active life, late hours, too much irregularity, dissipation and drinking, in the forty-fourth year of

his age, contracted a diforder, for which he had found it necessary to feek advice of a furgeon in London, who gave him some medicines suitable to his cafe, and in a few weeks he was concluded to be perfectly cured, but, in about a month afterwards, he complained of excessive deafness, and of foreness and ulcerarion in his throat; he now returned to London and was put upon a mercurial course, which, with a decoction of the woods he had continued nearly fix weeks in the depth of winter, when the feason happened to be remarkably intense and fevere; and, by staying out to a very late hour, an obstructed perspiration was the consequence; he was the next morning attacked with a sense of

coldness and shivering succeeded by heat, a naufea and vomiting, thirst, anxiety, and comatous affections; the cure was effected by evacuations, epifpastics and antiphlogistics. But there remained a stupidity, not any ways natural to him, which was obvious to all his acquaintance, and his attentions were with difficulty removed from one object to another; his friends confulted an eminent physician in London, who did not hesitate to pronounce an incipient madness and was but too right in his prognostication, for, notwithstanding all the usual means were tried to prevent it, a confirmed delirium came on, his mind became agitated with various ideas, notions and affections indifcriminately; he fometimes

raved loudly and was very turbulent, was fometimes cheerful, at others melancholy and fad, and his hand was almost ever fixed on his forehead, as if in pain; a branny eruption on the skin broke out, soon after which it was observed he much seldomer lifted his hand to his head; an abfcefs formed on the tibia of the left leg, which terminated in a large spreading ulcer. On the 25th of August, 1782, he was recommended to apply to me, when I ordered a feton between the shoulders, and a folution of the fublimate and camphor, by which means, in about fix weeks time, his reason returned. the ulcer healed, and the branny eruption disappeared; but, upon his discontinuing the folution, in less than a month the eruption re-appeared and his mind feemed as much deranged as ever; but, upon repeating the medicine, the fymptoms, both of body and mind, were much palliated, and the patient feemed again tolerably well for fome time, but all the fymptoms again recurred, and his mind, from that time to the prefent, has never been clear and undifordered.

### C A S E XLVII.

J. T. a young gentleman of family and fortune, of a slender constitution, and inclined to be scorbutic, in the year 1777, contracted a disorder, for

which he put himself under the care of a furgeon, who plied him liberally with mercury and strong purges, which had rather aggravated than alleviated his complaint, and feveral other remedies were internally and externally administered, but without the relief that was expected from them; it was therefore thought adviseable to falivate him, which was accordingly done, and he afterwards was proceeding in a course of mercurial alteratives for a fmall ulcer, which still remained in his throat, when he accidentally received a fall from his horse and sprained his ancle, for which he was told to put his leg in cold water, which he had not repeated very often, but extreme loss of strength and inactivity succeeded.

together with disquietude of thought and anxiety; he fwallowed with difficulty and pain, his taste was imperfect, his voice feeble and indiftinctly articulate, he funk into a state of torpid infenfibility, and must have perished for want of food, had he not been nursed and fed with the same care as is shewn to a babe; he often flavered from his mouth, flood like a statue, with his eyes immoveably rivetted to the ground, and could not be easily rouzed; his extremities always appeared livid, and felt cold even in the hottest day of summer; the pupils of his eyes were much contracted, and the whole of the eyes themselves appeared as if covered with thin varnish; his cheeks were drawn in and hollow, but his nose, particularly at its tip, was red and burly, and covered with carbuncles. As his conflitution had fuffered much from the immoderate and frequent use of mercury, by the action of which, the mass of blood must have fuffered a confiderable degree of diffolution, and he was naturally of weak nerves, when he was first committed to my care, I put him under a mild alterative course, assisted with nervous medicines, enjoining a proper degree of attention to management and cleanliness; by which means, within a few months, I was just able, by repeated interrogations now and then, to extract from him a word or two, by way of answer; for the fixed humour in his face, a feton was made between his

shoulders, and other remedies were tried, but to little or no purpose, for he still continues pretty nearly in the fame state, except, that he can now walk about and fometimes feed himfelf; and, although he has recovered enough of his reason, so as to be able, after much deliberation, to make a pertinent reply to any question that is asked him, yet, from being a sensible, accomplished and well-educated young man, of a lively imagination and the most acute and promising parts, which was the case before he unluckily fell under fuch rough and injudicious treatment at the beginning of his diforder, he is now reduced to a melancholy spectacle of half-animated human existence, nor has he the most

forlorn hope of ever again being capable of tolerably well fulfilling the ordinary duties of life, or even going through the common and familiar forms of focial intercourfe. Such are the terrible confequences of mercury, when misapplied, or given in too liberal a manner to persons of a lax habit, and numberless are the dangerous confequences which accrue from taking cold when under a course of mercurial medicines.

# C A S E XLVIII.

A YOUNG gentleman, of a thin delicate habit of body, from a fudden fright in his fifteenth year, was feized with a coldness, a quick and difficult respiration, tremblings and a contraction of the features of his face, and, although the cause of his fear was removed, yet it had made fo strong an impression on his mind, as almost to cause an entire privation of his intellectual faculties; he was, at times, under great anxiety, fighed and shed tears; his hearing was depraved, he often reeled about with his hand to his head as if he was giddy, and, febrile fymptoms coming on, he was treated

accordingly, and recovered, but never fince has been able to regain his reason, his mind having never been sufficiently capable to free itself from the excessive agitation which it had undergone; and, although it is a great while fince the accident happened, his memory and imagination continue in such a state of derangement and debility as to preclude all hopes of recovery. I have had the management of this unfortunate young man for upwards of fix years, and all the affistance I have ever been able to render him has been by repeated vomits, as he is apt to abound with a prodigious quantity of phlegm. And, indeed, in the general treatment of mania, it must be readily allowed. by those under whose care it has particularly fallen, that emetics, are, in general, capable of rendering the patients more effential fervice than it is in the power of cathartics to do, and that they will be found much lefs debilitated by their operation than by those of the latter.

### C A S E XLIX.

As the preceding is one of the most obvious causes of infanity, so an obstruction of the menstrual discharge, either from affections of the mind, or from any other cause, must be allowed equally so, which the two subsequent cases will particularly serve to

demonstrate: -P. T. a young lady of a delicate constitution, in her eighteenth year, on catching cold at a particular period, by fitting too long in her damp cloaths after having been accidentally exposed to a heavy shower of rain in the evening of the same day, was attacked with a rigor, restlessness, lassitude and pain in the loins, which was foon after fucceeded by great heat, a frequent and full pulse, pain in the region of the womb, with fwelling, heat and tension; an inclination to vomit, dry skin, redness of the eyes, and pains in the legs, with great anxiety and depression of spirits. The practitioner who was confulted ordered a vomit in the evening, and, the following morning took away ten ounces of blood;

at night an opiate was given her, an emulfion of almonds, with the addition of nitre and gum arabic, and a blifter was applied between the shoulders; but on the third day, from the first attack, great thirst, resslessness and delirium coming on, the case was apparently dangerous, and the best medical affiftance was procured, by which means the acute continual fever was brought to a favourable iffue on the thirteenth day; but the patient still complained of pain and weight in the head, was subject to loss of memory and recollection, and the functions of her mind were obviously impaired; and, as she recovered her strength, she was often impelled to commit many impertinent, ridiculous and abfurd actions,

grew impatient of controul, and on every flight and trifling occasion flew into passions unusual to her; would often involuntarily shed tears, laugh or fing; was very fly, and, in her expreffions uncommonly profane and obscene; her appetite and digestion were bad, and she had cedematous swellings of the feet. Proper means, for feven months fuccessively, had been tried to restore the menstrual flux, but to no purpose, and in the latter part of the month of November, 1778, she was configned wholly to my care and management. Her pulse was weak, slow and foft, the circulation apparently languid, her countenance white and bloated, and she was subject to tremors and spasms; I advised a gentle emetic,

which operated very well, and brought off from her stomach a large quantity of chocolate coloured bile and much phlegm; the warm pediluvium was used every night; the camphorated julep was administered every morning early, an hour before dinner, and at five o'clock in the afternoon; besides which she took every night, and

R. Conferv. Rorifmarini 3 ss.

morning, a bolus, as follows:

Limatur. Chalyb. gr. xv.

Spec" . Aromatic gr. iij.

Syr. e Cortic. Aurant. q. s. fiat Bol. fuperbibend. Bal. fingul. Cyathum Infust
Raphani.

In this mode of practice she continued from the 23d of November, 1778, to the latter end of April, 1779, an

emetic being given at the period of about nine or ten days at farthest, and now and then an omission of the night bolus, on account of the turbulent and outrageous manner in which she acted which occasioned an impossibility of giving it her. The menses re-appeared on the 27th of April, foon after which fhe visibly recovered her strength, and, as that returned, her reason became less clouded, and she was less violent and mischievous in her manner; the derangement of her mind evidently lessened, and, upon the fourth reflux of her menstrual discharge, which occurred pretty exactly at the stated period, she was so well as to be admitted to the company of the family at meal times, and continued to affociate

264 CASES OF INSANITY, &c.

with us in unremitting decency and decorum of behaviour for upwards of three years; and, except an opthalmia, occasioned by an obstructed perspiration, from her getting wet in the seet, which, after a few days, gave way to bleeding, and antiphlogistic remedies, she had no fort of complaint till she returned home to her friends in Norfolk, where she has ever since remained free from every maniacal symptom and is at this time in good health.

## CASE L.

A WOMAN, aged thirty-one, of a plethoric habit and strong constitution, from a suppression of the menses, occasioned by a particular disposition of the mind which agitated her to fudden fits of the most violent anger, in the year 1780 became infane; fhe was extremely violent, and expressed the most vehement abhorrence to persons with whom she had before lived in habits of the most friendly intimacy; but the strong and 'rooted impressions made on her mind, by that fit of anger which first laid the grounds of her complaint, evidently appeared at all times to be predominant; and,

for three years together, she had not been able to get the better of it; nor had she once, in all that time, menstruated, although, for feveral years before, she had always been unremittingly regular in that respect. When she was first fent to me she had the hæmorrhoids to a very violent degree; she had been always suffered to have her own way, never been under proper restrictions, and had, in general, lived upon grofs and viscid food. In short, not the least check had been given to her unruly appetite, nor had she even been kept decently clean, nor taken any medicines properly adapted to her complaint, and her conversation always ran upon one and the same object; she was costive, had a dry cough, her face

CASES OF INSANITY, &c. 267 was florid, she was loud and loquacious, the pulse was hard and strong, she was wakeful of nights, and her skin was harsh and dry. To deplete the vessels and attenuate the circulation' I directed ten ounces of blood to be taken from her arm, lenient purgatives were given occasionally, and a seton was made between her shoulders: after a fortnight, the bleeding was repeated; her regimen was the reverse of that to which she shad been accustomed; the pediluvium was used every night, and I put her under a course of mercurial alteratives, in which, after having continued about two months, the bodily fymptoms vanished and evident figns of fanity appeared; she menstruated, and having continued so to do

at regular periods, for twelve months fuccessively, she returned to her former habitation, and having strictly adhered both to the medical advice which was given her at the time of her going away from me, as well as the rules laid down to her for the better regulation and government of her passions, she has ever since continued well, and without any relapse.

### CASE LI.

A GENTLEMAN, who, for more than nine years before, had been subject to hypochondriacal infanity, under the dominion of which he had been subject

to a variety of disagreeable and painful feelings, and almost without intermission for that whole space of time, for the major part of which he had been under my care, was, in July 1785, fuddenly feized with a pain in the head and loins, weariness of the limbs, shivering, coldness of the extremities, firetching, yawning and ficknefs, with vomiting, to which, heat and thirst succeeded; his skin became moist, a profuse sweat broke out, and a confirmed intermittent was the confequence; which, after eleven fuccessive paroxysms, which returned every third day, by the affishance of emetics and the bark, was entirely overcome, and he was both cured of his fever and infanity at the fame time, and has remained free from either ever fince. In Doctor Monro's Remarks on Dr. Battie's Treatife of Madness, he has mentioned three instances of intermitting fevers coming upon madness of long standing, two of which, he affirms to have seen himself, where the relief of the one proved the cure of the other.

## CASE LII.

A. M. a gentleman of fortune, remarkable for his intemperance of diet, fudject to regular fits of the gout, and an hereditary ashma of the humoral kind, after having had not the smallest

appearance of his usual gouty paroxysm for two years, became subject to an uncomfortable flate of the bodily feelings; every trifling occurrence became an object of the most intense distress and inquietude; he was difgusted at every thing and totally dif-relished all those enjoyments and recreations of life which had before given him pleasure; and, by a constant habit of anxiety, his mind, at length, became totally funk and depressed into a constant distressful dejection and melancholy, and, what was very extraordinary, from the very first appearance of infanity, his asthmatic complaints totally disappeared, and continued fo to do from about the 5th of February, 1784, till the ninth of November of the same year, two days

after which he had been feized with uncommon drowfinefs, wind and ficknefs. and in a few hours afterwards he was attacked with pains in the ancles and calves of his legs, when he at once became clear in his imagination, and as reasonable as ever he was in his life, and continued fo for nearly nine weeks, a period the same as the gouty paroxysm; but during that space his asthma returned, and upon his becoming again infaen, receded as it had done before; he now expressed the most violent resentment and indignant design against himself, and would have committed some act of personal violence against himself, had he not been carefully guarded against it; he continued without the least lucid interval under

the influence of the most desperate infanity, till the latter end of April following, when he had a regular fit of the gout, and his asthmatic complaints returned with the same degree of intellectual clearness and perspicuity as before, again receded upon the going off of the paroxysm, and lest him again in the fame melancholy fituation as above described; in which state he was removed from my care, and, the last time I heard of him. I was informed that he had had no return of the gout at all, that his lungs were in a very weak state, his aspect pale and fickly, that he was much emaciated, and had every fymptom of a deep decay.

#### CASE LIII.

G. H. a man in the 38th year of his age, by trade a brass wire drawer, of a low stature, thin, bilious, and of a fallow complexion, was, at times, affected with violent pains in the bowels, particularly about the navel, which were attended with a confiderable distension of the abdomen, and often with contractions of the muscles of the belly. In the beginning of this complaint, as the cause was supposed to be wind, he had carminative medicines given him, but feldom without any other effect than increasing the pains and uncafinefs, which, after a continuance of about an hour, gradually

decreased and went off of themselves: he was feized with an attack of this kind every day, generally about the fame hour, and it was usually preceded by a violent itching of the nofe, with a fensation of heat and tension in the right hypochondrium; during the paroxysm he complained of thirst, was giddy, and fometimes very fick at his flomach; he had confulted an eminent physician in town, who partly attributed the complaint to the business which he was obliged to follow, and partly to the hypochondriac affection, and, from what I could learn, the basis of his prescription was the Pilula Gummofs, the cortex and opium, preceded by an emetic; but from these medicines he derived no fort of fervice,

and in a short time his ideas were, at times, perceived to become fluggish and interrupted, and, at others, unconnected, and passing into a rapid succession a confirmed hypochondriac melancholy foon after took place, and he would often assure the by-standers that he was made of glass and was fearful of moving unless he should instantly break to pieces, and after continuing in this state for some weeks, without either the assistance of proper medicines, fuch a regimen as was fuitable to his case, or that kind of management fo apparently necessary. I was confulted on his account the feventeenth of May 1783, and found he had had but little fleep of nights, the faculties of his mind were much

impaired, his memory almost annihilated, he had frequently a palpitation of the heart, with anxiety, fighing, indigestion, and much hypochondriac languor; he was subject to congestions of viscid matter in the stomach, had chilly fweats, was subject to flatulencies and eructations, was pale, emaciated, weak, and inclined to be costive; there appeared a vacancy in his looks, he obstinately retained the idea that he was made of glass, and that, upon the least motion, he should be shivered to pieces; this opinion made him almost motionless, and often gave him a cataleptic appearance, he moved neither hand or foot without the greatest caution and deliberation; his voice was fmall, timid and indistinct, and his position, in

general, was fupine, with his legs and arms stretched out; his pulse was flender and intermitted every third or fourth stroke; his respiration was somewhat difficult; his urine was very variable, fometimes turbid and milky, fometimes was observed to have fine threads fuspended in it, refembling bits of spiders, and at others deposited a white light fediment; his stools were fometimes frequent, bilious, loofe and fætid, and at others costive, and of a clay-like colour; there was a continual tumour and tension of the abdomen, with a rumbling of the intestines; his eyes were hollow, the pupils much diftended, and the eye-lids puffed and livid; his breath was unufually fœtid and offenfive, from which, as well as the almost

continual nausea under which he laboured, and many of the above recited fymptoms, I was induced to believe that worms, from the irritation they might occasion in the intestines, produced the debility in the first pasfages, and primarily contributed to the disorder in question; upon enquiry, however, I could not find that the patient had ever been suspected to have had worms, or to have voided any either upwards or downwards; but, ftrongly possessed with that idea, from the recollection of having often feen children affected with delirium and coma from the irritations occasioned in the flomach and intestines from those pernicious infects, I directed the fol280 CASES OF INSANITY, &c.

lowing ointment to be applied to the umbilical region:

R. Fellis Taurin. Alöes fing. 3j.

Ung. alb. camphorat. 3ij.

m. f. Unguentum cujus pauxillo inungatur ter in Die Locus Umbilici.

I likewise ordered him a decoction of quick-silver in water, an ounce to a pint, to be given him for his common drink, and the following draught to be taken every morning:

R. OL. Ricini.

Aq. Font. sing. zij. m. f.

Hauft. omni Mane jejun. Ventriculo exhibendus

In the evening of the fourth day, from the beginning of this course, he voided by stool two worms of the broad, or Teretes kind, and the next day a third,

much larger and longer than the two former. As it was now plain, to a demonstration, that his delirium most probably owed its excitement to a vermicular affection, and, as his strength would admit, more efficacious anthelmintics took place, with now and then a gentle mercurial cathartic till he entirely recovered his health and the free use of his reason, and was able to return to his business; although the medicines were not totally left off for some considerable time, I did not hear of his voiding any more worms than those which I have mentioned, therefore it is clear that the vermicular fac was totally destroyed by the specific force of the medicines, as he has ever

282 CASES OF INSANITY, &c. fince continued free from any of the foregoing fymptoms, or any mental complaints whatfoever.

### C A S E LIV.

In the year 1782, I was fent for to a gentleman of fome eminence, in the commercial line, of a habit fomewhat rather fcorbutic, and of a constitution, if we allow diseases to pass from parent to offspring, with a natural pre-disposition to infanity, and, in his forty-first year, I was informed, by the gentleman who attended him, that in the autumn of the year above-mentioned, when the fcarlet sever and sore throat proved

epidemic in the town where he lived, he was feized with a fickness at the flomacli, laffitude and shivering, complained of head-ach, pain and tension in his throat; his skin became hot, his pulse was quick, strong and hard, with preternatural heat, and the functions of the brain were much disturbed; his deglutition became painful and exceedingly difficult; the tonfils and Uvula appeared inflamed, and white floughs and ulcerations were foon discovered: the mouth and fauces were covered with mucus, and there was much tumefaction of the throat; the scarlet efflorescence appeared on the third day and tinged the fkin of a dufky red colour, and was univerfally diffused over the whole body, with an ædema-

tous swelling of the hands and feet. The pediluvium was used, emetic tartar exhibited, both as an emetic and a purge; the fauces were cleanfed by the use of detergent gargles made warm; by which means, and a subsequent course of tonic medicines, intermixed with proper laxatives, the patient recovered from this diforder; but, his manner and conversation was soon afterwards observed to be very unlike what he was before his illness, his ideas were apparently incoherent, and his imagination flighty and perverted. In this incipient state of his infanity, a blifter was applied between the shoulders, an emetic was given him, the warm bath recommended, and fome other means made use of, but to no

fort of purpose; he grew worse and worse, till he became the victim of various and opposing passions and scarcely ever appeared to know or attend to any external objects whatever, he slept little, raved, and was fo very turbulent, that it became necessary to fet a watch continually over him. At this period of the disorder I first saw him; his breath was hot and offensive. he had a rumbling in his bowels, a catarrh, with frequent fneezing, and a dry cough from habitual indigestion; he was ridiculously timid and fearful. at times extremely loquacious; his urine was either pale and in small quantities, or turbid and very highcoloured; he was obstinately costive. appeared deaf and inattentive when

fpoken to; there was either a flupid vacancy in his manner and appearance, or an unnatural brifkness of the eyes and then the most volatile utterance of unconnected jargon; he was subject to frequent eructations, often foamed at the mouth, and spat indiscriminately about on all fides of him, upon any thing, or any body that stood in his way; his pulse was hard, strong and quick, and his respiration tolerably free and eafy; I ordered twelve ounces of blood to be taken away, which was bilious and covered by a cake of gluten; a feton was also, by my direction, made between the shoulders, and the following prescription left with his apothecary:

R. Tartar. Emetic granaquatuor

Sacc. alb. 3 ij. misceantur optime &
fiat pulvis cujus capiat grana octo Mane

& Vesperi.

Capiat Cyathum Julepi camph. intermediis Spatiis quinta vel fexta qua que hora & Decocti Furfuris bibat ad Libitum. His regimen was ordered to be cooling and laxative, and, upon my next vifit I found him confiderably better in every respect, and advised a continuance of the medicines and regimen, the feton discharged exceedingly well and had an amazing good effect, he grew more and more rational, and became quite fo at the end of fix weeks, when he was attacked with the gout in his hands and feet to a very fevere degree indeed, which was totally carried

off for the present by promoting perspiration and a fuitable regimen; but his mind was in too feeble a state to conduct his affairs as usual, nor as he fince been capable of fo doing; fince its first paroxysm the gout has regularly returned in the spring and beginning of the winter, at which times his intellects are clear and unclouded, and he is tolerably focial, but, at others, shy, suspicious, gloomy, and averse to company or conversation of any kind.

# C A S E LV.

IN the case of this patient I may also previously observe, that there was an hereditary pre-disposition to madness; he was of a very thin and delicate habit of body, the tone of the vascular fyslem had been much enfeebled by an indolent and sedentary life; he had, for fome time past, been subject to the piles, attended with flatulencies, indigestion, obtufe pains in the right hypochondrium, immediately under the short ribs, anxiety, depraved appetite, costiveness, and a cough, with expectoration, sometimes tinged with blood, fwelled face and deafness, with a fense of weight in the head and dimness of fight,

CASES OF INSANITY, &c. 200 accompanied with symptoms of infanity, which, for a time, were not fo violent but that he knew the true appearance and fituation of furrounding objects; but, at length, he became totally infane, in which state, when I first saw him, I think I never heard a maniac speak and reply with such an animated velocity of ideas; and, as I was well informed by those who had been long acquainted with him, that his natural intellectual powers were rather feeble and contracted than otherwife, we might on this occasion apply to him what Shakespear says in Hamlet,

<sup>&</sup>quot; How pregnant his replies are,

<sup>&</sup>quot; A happiness that madness oft hits on,

<sup>&</sup>quot; To which fanity and reason could not be

<sup>&</sup>quot; So prosperously delivered of,"

As the pulse sufficiently justified the operation, I took away eight ounces of blood, which afforded but little information; but, as the complexion of it rather indicated inflammation then otherwise, after laying down some rules for the regulation of his diet, I prescribed an emetic to remove the congestion of viscid matter in his stomach, to which he had been subject, and afterwards an emulfion of almonds, with the addition of nitre and gum arabic, manna and foluble tartar, after this I directed a feton between his shoulders, the warm pediluvium at bed-time, the camphorated julep three times a day, with a blifler on the right hypochondrium. Five days after the first operation, the bleeding was repeated in the fame quantity as before, and in, a few days after, he became less flighty and frantic in his manner, and lefs volatile in his expressions and replies; his costiveness and hæmorrhoids were removed; his appetite, which at best was never very great, was much relieved, the cough left him, and in fix weeks time he had recovered his hearing and fight, and, by the use of tonics and exercise, with the help of fea-bathing, the functions of his mind recovered their full force and power, and he remained well for fome months, when, getting cold, and being attacked with an eryfipelatous humour in his face, which was too hastily repelled by a topical application, recommended by an ignorant person, his maniacal fymptoms all recurred, and continued for a much longer time than before; and, although a lucid interval fucceeded, yet his rational faculties had received too much injury to render him capable of fulfilling tolerably well the ordinary duties of life, of passing through the common or familiar terms of social intercourse, or even of being trusted to the disposal of his own person or fortune.

## C A S E LVI.

IT were to difregard the testimony of truth to deny, that an habitual course of intoxication, not only induces, but facilitates the approaches of infanity.

From the many cases which have fallen under my care in that line of diforder, from inebriation, either with spirits, wine, or other fermented liquors, I have felected the following instance as an exemplarily useful memento to those who perfevere in this pernicious and destructive practice, so very subverfive of the dignity of the human character. On the oth of October, 1783, I was defired to attend a gentleman, whose nervous system had been long injured, and his memory almost annihilated by excessive drinking; he was naturally a man of strong and lively passions, and, in the first part of his life had lived temperately, and had been much esteemed by his acquaintance for his industry and integrity; but from an

habitual course of drinking, he had become infane for three weeks, and, by proper means had recovered; reverting however to his former habit, the flame of intoxication unquenchionably broke out; prior to which he had been loaded with a general plenitude and groffness of habit, his health had obvioufly declined, a train of hypochondriacal fymptoms had made their appearance, his nights had been restless and disturbed, and his fleep little and unquiet; he had complained of habitual languor, and fome degree of dejection and melancholy had always been obvious, unless when he was too much influenced by intoxication; and, more than once, under the depression of the most intolerable languor and despair, he had

endeavoured to commit fuicide, which he would certainly have perpetrated, had not the power been taken from him. In his fits of inebriety he was violent and outrageous in his manner, mischievous and abusive to every one who came in his way, and in this state he had continued for fixteen days and nights, and for the whole time had neither flept, nor been undressed.' By the interpolition of his relations, he was confined, and, by my advice, put under fuch restrictions as were absolutely neceffary to open the way to a regimen the very reverse to that which he had too long followed. The tones of his whole frame were injured and diminished, his features were bloated, his belly was tense and hard, his breath hot and.

offensive, he was convulsed, violently delirious and trembling; his eyes were distorted and inflamed, he had a hiccup, with loss of voice and stupidity, and a yellow cast over the whole surface of his body; his pulse was weak and irregular, his tongue was tremulous and black, and his urine was passed involuntarily. In this hopeless stage of the business it were in vain to expect relief from the hand of medicine, or from whatever was proposed, he fell a martyr to his intemperance on the fourth day after I visited him, for all that was done feemed only to protract the hour of death, fince he had given fuch a shock to his constitution as he could never recover.

### C A S E LVII.

As the foregoing case serves to exhibit the most striking instance of the fatal effects which flow from the baleful habit of excessive drinking, so the following, on the other hand, may ferve as an encouragement to the intemperate to retract in time from this vicious course, which bears such numberless evils in its train. It was about four years ago I was applied to in the case of a gentleman of relaxed fibres. of a corpulent constitution, about two and forty years of age, and naturally of acute and painful fensations, who had for two years past habitually addicted himself to excess in the use of

fermented and spirituous liquors, the confequences of which were indolence, languor, debility, palpitation of the heart, indigestion and difficult respiration; he became unsteady in his conduct, pusillanimous and indecisive, and not only the faculties of the mind were debilitated, but also the functions of his brain were apparently disturbed; want of appetite, nausea, and great weakness of the stomach ensued, with tremors, fear, distressful feelings and apprehensions; he complained of heat, pain in the right hypochondrium, a finging noise in his ears, and had an epileptic fit; from which, when he recovered, a total want of fleep fupervened, and the derangement of his CASES OF INSANITY, &c.

mind was such as to require the forcible interposition of his friends to prevent mischief to himself and others. When I sirst saw him he had gotten no sleep for seven nights successively, and his bodily complaints were visibly accompanied with the greatest despair and horror; and he was, as Spenser says, in the passage which allegorizes this situation of the mind whenever it is the victim of despair:

- " Ever fitting on the ground
- " Musing full fadly in his fullen mind,
- " His grizzly locks long grown and unbound,
- " Disordered hung almost his shoulders round,
- " And hid his face."

His countenance was florid, he was unfleady in his walking, there was an enlargment of the pupils, and a vacant staring appearance of the eyes, which were much distorted, with a quick full pulse; the tongue was white and dry, the muscles of his legs and arms appeared very much emaciated, his bowels were in an excessive state of conflipation, and apparently distended with wind; at times, he feemed much tormented with pain, which he expressed by frequently bending himfelf double, rigidly contracting the muscles of his face, and biting his under lip till it bled. I prescribed bleeding, and strove to procure a free passage for the excrements by repeated doses of soluble tartar, but that failing, recourse was had to a stimulating clyster, which answered the purpose for the present, after which, by mild aperient medicines, the bowels were kept

in a proper state of laxity; but a dangerous diarrhaa coming on, in which the stools were frequent, liquid and sharp, notwithstanding his maniacal affections, I ventured upon opiates with the Radix Rhej. and proper astringents, with the Decoctum Album, which, after a few days, entirely removed this fymptom: The same derangement however possessed his mind as at the first, alternately with vehement passion and anger, loud mirth, or deep dejection; his urine fometimes passed off involuntarily, but his stools never; he had frequent spafmodic pains in his arms, and a flight paralysis in his left leg, which was thereby almost entirely deprived of motion; he had frequently fo obstinate a retention of the fæces, that stools were

procured with difficulty; a blifter was applied to his leg, a feton made between the shoulders, with the use of the pediluvium three times in a day, and an electuary composed of camphor, valerian, and mustard seed; in this courfe he had continued about three weeks, when the good effects were obvious, the use of his leg was restored, and he recovered his health and reason tolerably well; and it being a proper feafon of the year for using the Bath waters, he went thither, accompanied with a near relation, and, in a few weeks, his general health was restored, and the trace of every insane fymptom disappeared: and now felfconvinced how much he would be exposed to a relapse, from reverting to the cause of his former terrible disorder, he became unremittingly diligent in the strict observance of temperance, and a due regulation of his passions.

## CASE LVIII.

THE case of this patient was circumstantially described to me by letter, dated, Minories, London, 21st June, 1784, in which it appeared that the cause and effect of her infanity had proceeded from the suppression of an old ulcer in the leg, to which she had been subject from a billious quality in the blood for upwards of six years; she was naturally of a phlegmatic cold

habit, and had been long under the care of a furgeon, who enjoined a proper regimen, and otherwise treated her according to the indication of her case; notwithstanding which, the ulcer still remained stubborn, accompanied with a large discharge, nor would it in the least yield to the united endeavours of many gentlemen of the faculty who were referred to concerning it; she had never been quite regular in her menstrual periods, and having heard of a celebrated empirical pretender to medicine, who she was told had performed wonders in fimilar cases, she very readily fought his advice, and. in less than fix weeks, by his extraordinary skill and abilities, the discharge from the ulcer was entirely suppressed:

and the ulcer itself being entirely healed up, the practitioner had the credit of having wrought an almost unprecedented cure; but his newly acquired reputation was but of short date. for, in less than a month afterwards, fhe was attacked with a variety of hysterical fymptoms, and fuch other gradual changes, as terminated in a confirmed mania, too generally the unhappy consequence, when morbid discharges have become habitual, and are either fuddenly suppressed by art, or, from any fudden change in the constitution, cease to flow spontaneously, and where no other drain has been substituted in their stead; it was now early in the disorder, she laboured with extreme anxiety, fear and distress of mind, in general

CASES OF INSANITY, &c. talked incoherently, fometimes raved. was furious, had little or no fleep; there appeared much tension of the abdomen, she was costive, her breath was extremely offensive, she had frequent spasmodic contractions of the joints, appeared much deafer than before, she was attacked with maniacal fymptoms, she had an eruption in her face of the eryfipelatous kind, the pupils were much enlarged, the eye-lids fwelled and inflamed, she had frequent acid eructations and expectorated a thick purulent matter, her eyes were in constant motion, she had often a loud palpitation of the heart, was constantly changing her polition, her pulle was quick, strong and hard, with much preternatural heat, her respiration was

difficult, and her skin squalid and dry; her diet had been very improper for one in her fituation, therefore a regulation of it was immediately advised, and, by way of attenuating the lentor of the fluids, she was bled to twelve ounces; a feton was made between her shoulders, and an iffue opened below the knee in the leg that had been ulcerated; an emetic was administered on the third day after I faw her, which brought away a great quantity of viscid phlegm and bile; the foluble tartar was given her, in the quantity of fix drachms the day after the vomit, which was again repeated on the fifth day, besides which, by way of alterative, she took the following pill:

R. Mercurij calcin. 3 ss.

Ocul. Cancror. ptt.

Conf. Rofar. nitr. fing. 3j.

m. fiant pilul. Viginti quarum capiat unam omni Nocte Horâ Decubitus cu Unciis duabus Julep. e Camphor. & Aq. puræ p. æ. mist.

In this course she continued, with very little alteration, till the expiration of five weeks, when, the catamenia appearing in a small quantity, the maniacal symptoms abated; they returned again in a much larger quantity at three weeks afterwards, and regularly, for two months after, when she was so well as to be trusted by herself, and could write and converse as rationally as ever; and, by the occasional repetition, of deobstruent and alterative medicines,

has remained very well ever fince; the feton has been dried up for fome time, but the iffue in her leg is kept open and discharges very well.

## C A S E LIX.

Communicated in a Letter from a Lady.

SIR,

THE following case is of a person whose whole dependence for support is on her industry, and I should be much obliged to you for your opinion on it, and a prescription for her to sollow; she is a very worthy woman in her station, and I should therefore be happy to relieve

great deformity of the body; the faline

mixture, Sp. Mindereri Pulv. Contray. c. Castor Crocus Valerian Pil. fætid & Cortex, were given as the variation of the fymptoms feemed to indicate, but the disorder increased, and, for ten or twelve weeks. she has been funk into a religious despondency, accompanied either with unremitting fervors of zeal or devotion, incredible expectations of divine manifestations, much emotion and ardor, or the groundless fear and apprehension that she has irretrievably incurred the refentment of the Deity, and shall hereafter undergo the punishment of the most hardened and atrocious finner, although there has been no part of her life open to blame, or in the least governed by irregular gratisication, but, on the contrary, pure and

immaculate, both in thought, word and deed: from these distressing ideas nothing can rouze or divert her, although she converses rationally, but reluctantly on any other subject; her appetite is good, the pulse in general too quick without fullness, the tongue for the most part moist, the body inclined to costiveness, the water natural in colour and quantity, but feldom deposing any sediment; she has sometimes perspired pretty freely in the night, but generally found herself the more relaxed the enfuing day; no medicines have been given her now for five or fix weeks, except, through necessity, fomething laxative.

Portman Square, June 30, 1781. I am, &c.

## MY ANSWER.

MADAM,

A Ther advanced time of life, I fear but little can be done to assist the patient whose case you have fo obligingly submitted to my confideration; if she could be conversed with on any regular plan, her mistaken notions of religion might probably be corrected; but, in religious melancholy, I have repeatedly found that argument has had but little weight, for it unfortunately feems to be the nature of the disorder to involve the mind in the most insuperable and inextricable difficulties, and, thus influenced, the patients relist or evade every argument

which the most sensible person can adduce from the most rational ground to undeceive the deluded mind; I think endeavours should be used to persuade her, that it is entirely a complaint of the body which thus affects her mind. It is observed, that persons in general, who labour under fanatical infanity. usually die of a flow continual fever: perhaps she is not altogether difinclined to company, although she may to business or amusements; the mind should be diverted and kept in as tranquil and calm a state as possible, and all conversation upon her favourite topic should at all times be declined; electricity may be useful to her, and also frictions of the legs, arms, and trunk of the body, and even the belly, with a

flesh brush, as, by these means, perspiration will be encouraged, and the circulation quickened; she should rife early, and use as much exercise as the strength and formation of her system will admit of; as a medicine, I would advise fix grains of camphor and four of nitre, with three grains of the powder of squills made into a bolus, with conferve of rolemary, to be taken every morning, noon and night, and with a view to relieve her Typhomania, fhe may take a cupful of the camphorated julep, and repeat it as occasion may require in the night; the Oleum Ricini I would advise as an occasional laxative, and indeed it appears highly necessary that her body should be always kept in a moderately relaxed

state; reclining her head over the steams of hot water, in which a quantity of myrrh, camphor and rofemary flowers, have been infused, may be very ferviceable, and may be repeated at those times when the fervors or horrors chiefly prevail; the peculiarly bad structure of her body might probably afford some reasonable objection to an emetic, or it would have been right to have tried it.

"WHEN you may think proper to write to me again, the favour will be honourably esteemed

By Madam, &c."

A few weeks after I had fent the above advice, I had the fatisfaction to learn that my directions had been punctually

attended to, and that the patient had found confiderable benefit, for which I received the most flattering tokens of respectful acknowledgments.

## CASE

A. G. the master of a coasting vesfel, aged about thirty-five years, of an atrabilious and fcorbutic constitution, which had rather fuffered by the too free use of spirituous liquors, and of a frame of mind peculiarly favourable to, and susceptible of the impulse of excessive terror, being at fea, about ten leagues from the shore, was fuddenly terrified with a luminous

appearance in the air, refembling, as he thought, a woman of gigantic stature, arrayed in white and splendid garments, of a most tremendous countenance, which made so deep an impression on his mind, as almost instantly to bereave him of his fenses, and it was with much difficulty he was fecured and got ashore without committing some act of felf violence, which, in his fits of desperation, he obstinately seemed bent upon, and would more than once have put an end to his existence, had he not been prevented. He was a strong, powerful, muscular man, and, when brought to my house on the fifth day of February last, it was as much as three flout men, who attended, could manage him; although he was in a

strait waistcoat; indeed he had arrived at the most outrageous pitch of phrenitic infanity; and feemed to labour under the deepest distress of mind, his respiration was hard and difficult, he had had no fleep from the time when he first received the shock, which was now a space of fix days and nights; frequently shivered, was sometimes all over convulfed, had a most extraordinary ferocity in his eyes, the Tunica albuginea of which, was streaked with red; in the corners was a fordid rheum, the lids were tumefied, and the pupils much distended; his countenance was bloated and of a crimfon hue; he had a quick and full pulse; his tongue was white and tremulous, he foamed at the mouth, and his teeth and lips were

covered with a viscous fordes, and there was rather a greafy appearance of the whole face, in the features of which it is easy to conceive that there could not be a greater combination of fear, horror and despair; at intervals of a few minutes he appeared more calm and eafy, and would then fometimes answer (although confusedly) to those questions which were proposed to him: but the mind could not free itself from the pressure it had fustained, and, as if he could not think of any thing but the fingle object of his terror, he reverted into fuch fits of rage and desperation, and was so obstinately bent upon his own destruction, that it was with difficulty he was prevented from beating out his brains against the wall.

or upon the floor, notwithstanding his hands and feet were strongly secured, and he was confined in a cell. In one of those frantic paroxysms, he actually beat his head with fuch violence against the floor, that for some time it remained a doubt with us, whether he had not fractured his skull, and it was not till many weeks after, that he thoroughly recovered of the bruifes he had given himself. As the curative intention feemed apparently to confift in depleting the vessels and attenuating the humours, I bled him very copiously from the arm, ad Deliquium Animi, and at the distance of twelve hours only, from the first operation, repeated it to the fame degree, a blifter was applied between the shoulders,

lenient purgatives of foluble tartar, with the volatile and neutral falts, were administered, and the camphorated julep, was given of nights, besides copious dilusion with small warm fluids. The reguline preparations, fo as to gently puke the patient, were given at the distance of four and twenty hours, for three times; venæsection was repeated twice, and, at the end of a month, being thoroughly restored to his right mind, and perfectly cool, collected and confistent, he returned home to his family, and convinced of the necessity of being more temperate in drinking, and by observing more regularity in that respect, he has, I am informed, continued pretty well ever fince.

## C A S E LXI.

The well-written letter, and most excellent description of this patient's case, I shall take the liberty literally to transcribe as follows:

M\*\*\*\*\*\*n, Aug. 30, 1778.
SIR,

YOUR favour of the fourth instant I received, and should have answered it ere this, but waited to give you the present symptoms. The person I wrote to you about, is a young man of twenty-eight years of age, of a delicate thin constitution; 'tis six years ago next Christmas, he was bit by a dog; it was fancied the dog was mad, but many persons were bit by

the same dog, who took no further notice of it, and no ill consequence following it, confirms the dog's not being mad. This young man was advised to be dipt in the fea, and take some medicines as preventatives, the chief ingredients of which were native and factitious cinnabar; he took these medicines so long till he found himself much weakened by them, and has frequently complained fince of a giddiness in his head, and a relaxation at times: last summer, he almost every evening used most violent exercise at fives. As we impute his present disorder to these causes, I thought it proper to mention them, though we never observed any thing remarkably particular in them till about the fixth or feventh of October

last: he had been a few days on a journey on business, the evening he returned, he appeared in an odd whimfical way, and very inconfistent in conversation, which was imputed to his being in liquor, and no notice taken of it; he went to bed, presently rose again, and infifted on going out, the fervants let him out, he remained out all night in the fields in a hard rain; the next morning he returned, complained of a most violent pain in his head, and that he had not flept fince his leaving home; was very feverish and unaccountably whimfical, fancied he had been poisoned, and that every thing offered him was impregnated with poison; violent and acute pains in his head for half an hour together; when

the pain ceased, an odd sensation left like the crawling of fomething within the skin, sometimes exceeding strong, then weak and faint; fmelt disagreeable fmells, exceeding timorous, violent flushings, then deathly paleness succeeded; at his first seizure no appetite, then a most extraordinary one, sudden gusts of passion, with strong aversions and affections to different objects, violent convulfive motions in his arms and legs, frequent and deep fighings; his water limpid with a fediment like fand. fometimes a great thirst; he found no relief from any thing but blifters on his legs, (which were kept open till a mortification was apprehended) and drinking strong mutton broth frequently; about Christmas he grew better, and has

been able to follow his business, though not perfectly well; as he has always been low, and rather shewed an averfion to conversation or cheerfulness, fince then we have observed him peculiarly low between the last quarter and first of the moon, at which times of the moon he has from the first appeared most affected. About two months ago he went to spend a few days with a friend by the sea, he drank rather more than his usual quantity, (which has not exceeded three or four glaffes of beer or wine after dinner and supper fince his first illness) the next morning he rofe early and bathed; at breakfast he complained of great pain in his head, and that he had not slept all night. and was very feverish and weak; he

lay down the best part of that and several days, but could get no fleep for feveral nights; great anxiety on his mind, violent fits of crying, would eat nothing but a little water-gruel, with a bit of bread in it; when he returned home, he continued the same for a fortnight, best part of the time kept in bed, with violent flushings, and a few flight convulfive motions; but these were suppressed by musk and nitre, of which he took many doses; the bark was attempted to be given but was found to heighten the flushings and paffions, therefore stopped; when in bed, he fweat freely; a dofe of James's powders was given, from which he found relief, and remained tolerable, only at times fanciful, especially

about the same times of the moon as before-mentioned: he has fince shewn the greatest aversion to conversation. and a kind of difgust to his friends. doubting their fincerity; he remained in this manner till Thursday the eleventh instant, when he went a journey, about twenty miles, which he takes about once a week on his business; since then he has been remarkably furly, which being the reverse of his natural disposition, we were alarmed, and on the nineteenth instant his passions broke out most violently; he drove all before him, and shewed most unaccountable whims, and then fet out on foot for his usual journey; he was fent after, but not overtaken; he returned the next day and took to his

bed, where he continued for some days, only rising when the fumes were on him, and at times appeared to be lost in childishness; he has for some time refused taking or doing any thing to relieve him, till the twenty-second instant, when he sent for the surgeon, and had a few ounces of blood taken away just to examine its state, when it was found to be of a very loofe texture. the crass being so very tender as not to refist the touch of a feather; he complains of a very uneafy and difagreeable fensation, which he can no otherwise describe than by likening to the winding up of a cobweb; his spirits and pulse are very irregular, for the most part exceedingly depressed; within these few days he seems a little

332

cheerful for a small space at a time; he has a very great aversion to converfation, and generally a very great languor and relaxation, attended with a numbness and slight pains in particular parts; till last Thursday he has taken very little, fince which he begins to recover his appetite; for some days he has been perfuaded to drink valerian tea, with feven drops of acid elixir of vitriol; at the beginning of his illness he had an iffue cut in his arm, which discharged greatly, but about six or feven weeks ago he had it dried up, and in vain, hitherto, has he been entreated to have another; we are fometimes afraid his fenses will be lost in childishnefs, at others, have great hopes; but as his complaint varies fo often, we

do not know what to think. The roots of his nails have frequently turned quite black, he has grown most exceedingly thin, and by nature was never robust. For these two months he has drank nothing but small beer and water, and lived very low; we are the more anxious for him, as he has nothing but his business to depend on, which must fail if he has no relief; but please God to restore him, he is in a genteel way, I therefore hope you will confider his case, and do your best for him, I flatter myself you are capable; you will let me know your fee, that it may be remitted you. At the time you fend your prescription, beg you will acquaint us what regimen he ought

to follow, and how he should be treated, as hitherto he has always been indulged in his whims.

I am.

SIR.

Your respectful

humble Servant."

In consequence of the above application, issues were directed to be opened in the left arm, betwixt the biceps and deltoid muscle, and in the interior part of the leg on the same fide, in the cavity below the knee; the vegetable bitters were prescribed, and the Julepum e Camphora, with an agglutinating regimen, the use of the cold bath and restrictive measures as cases of insanity, &c. 335 occasion might require, by which means the most alarming symptoms were mitigated, and the patient so far relieved, as to render him able to pursue his wonted avocations with more comfort to himself and friends.

THE END.

Allower of court in a few and court of the c

QUA FNO.
